Aside from wanting a piece of "history" (I was nice) why would anyone want an 850 interface? As an example, who really wants a 1030 modem except for the sake of history. Let's face it, the Atari 8 bits were good machines, but the printers, modems and other stuff were junk. Much better interfaces were made!

Most harddisks nowadays don't need to be formatted. Or better yet, you shouldn't. There is important data on that disk that the computer will not find but that the harddisk needs. Wipe it out and the disk will become unusable.

Have you tried partitioning them?

CU Mathy van Nisselroy

3170. Atari 1040ST

Keep in mind that it is not an 8-bit 6502-based Atari. It's a 16-bit
Motorola 68000-based system.

If the pictures are in ILBM format, look for an old program I wrote
called ILBMVIEW. I forget what graphics mode(s) it convert them to. It
won't convert very large images (the Atari only had a tiny screen space
compare to the Amiga).

If you want to see a "rare" 850, this is mine
http://www.silcom.com/~patchell/atari/atari850.jpg

This is the one in the aluminum box. I have no idea how many were
made. I bought this one in 1979.

The 850 printer interface actually worked pretty nice. The RS232
interface was pretty clunky in my opinion. After I got my ATR8000, the
850 spent most of it's time on the shelf, however.

>I want to use Graphics 15 screens (=4 colours) with DLIs.

Well, that other ColrView mode (the one showing 64 colours) uses, in fact,
3 GR.15 screens, using 4 shades of R, G and B on each screen respectively
and very clever DLIs... Better resolution, but less colours. Maybe that
would suit you?

Or do you have something else in mind? Like setting the 4 colours in each
row independently from the others? In theory, you could get 128 simultaneous
colors that way, but would need an additional 192*4 bytes to store the palettes
for all 192 lines... 8192+768=8960 bytes total for the image, the routine
to handle the DLIs would be pretty simple (and image-independant)...

On a somewhat related note, I was looking at a Pantone colour chart the other
day... has anybody ever found any relationship between those and the Atari
palette? Given that both seem to progress more or less in the same order through
the different colours...

I converted some Windows-Bitmaps (256 and 16.7) into the 256-9/11 Mode, but I had to prepare the resolution (80x96) on the PC. But the color-converting did a self-written Turbo-BASIC-routine. May be, that routine could be usefull...

Hi,

a few questions: are both the 800XL and diskdrive fully functional ?
What's more: can you ship to the Netherlands, and if so, how much for the whole caboodle plus P&P ? Do you accept UKP only, or Euro's ? What kinds of payment do you accept ?
Needless to say: I'm very much interested !
Kind regards,
Wef

There's a GHOST.BAS, two of them at ftp.spudster.org

One is in the GAMES/BAS directory and is different from
the one in Antic/87 which has the bas file and a fnt file I think.
I would guess you're talking about the one from Antic.
Get the ALL.TXT file from spudster and search for GHOST.
Spudster seems to have a fair amount of busted files.

Can't say which manufacturer it was. Looks to be a standard upgrade. The only software to be shipped was probably MYDOS. Just configure for a 192K ramdisk and format.

Otherwise, it looks to be compatible with anything that uses up to 192K banked ram that is XE compatible.

>
> Thanks guys!

I have preferred the 800XL. Its easy to upgrade if everything is socketed.
But the 1200 has more room for these upgrades, but PBI devices won't.

A difference to be aware of is that the OS is more 800 like than 800XL like.
Some XL/XE games (and/or carts) won't work.

Isn't that the way Wes Newell describes his memory upgrades, that 'KXLE'
ending?

CU Mathy van Nisselroy

PS Wes has a site http://4.33.97.43/ It worked when I tried it a week ago,
it didn't just now.

I ended up buying both :) .. also a XF551 and a bunch of carts. The keyboard on the 800XL is terrible. Every key must be pressed individually and very hard, any angle at all and the key won't depress. The 1200XL's keyboard is a bit better, but my old 600XL is still the easiest to type on. I love how the joysticks plug in at an angle on the 1200XL, and how the cartridges sink in as well.

Now I just need a place to put this stuff up!!

"JJ" <jj@nospam.com> writes:
> ST = SixTeen

Actually, it's Sixteen/Thirty-two, referring to the 16-bit external bus width and 32-bit internal bus width of the 68000 CPU. (There was also some speculation at the time that it also referred to Sam Tramiel, who owned Atari at the time of the ST's debut.) Atari subsequently released the TT030 computers, which had full 32-bit 68030 CPUs.

The 2002 MiniGame 8-bit coding competition is now officially open, and ready for your entries. For those of you who didn't participate last year, the aim is to write a game in 1024 bytes of code, for one of the classic 8-bit home computers. The deadline this year is 16th of September, 12.00 GMT.

You'll find the rules for submission at http://www.ffd2.com/minigame/ Questions and submissions can be sent to minigame@cling.gu.se.

Co-organizers are needed! I'm somewhat clueless when it comes to Spectrums, Ataris, and Amstrad computers. Let me know if you're interested in helping out.

OK - now I remember.

I cut my teeth on an Atari 400 (I have the flat fingertips to prove it). I remember as a teenager taking the bus to the mall with my life's savings (about $700) intent on buying a 1040ST at Electronics Boutique. I got there and I couldn't pull the trigger.

3202. MIO Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-27 02:27:09 UTC
From: CBClarke <cabell.clarkeNOSPAM@SPAMNOverizon.net>
Message-ID: <1KuS8.6265$t7.3124@nwrddc03.gnilink.net>
Source record: 28973

I have heard that the ICD MIO's were produced with two different power supplies (9VDC and ?AC). Is this true?

I have 1 working MIO which has the DC power supply, and another with no power supply. The second MIO will not work with the power supply from the first MIO. I am wondering if I have the wrong power supply for the second one or it's just broken.

Any ideas? (preferably knowledge and facts :^)

3203. Trade / FS - laptops for 8bit equipment

> Does anybody know, where (in Germany ?) I can find a digital Joystick
(e.g.
> Competition Pro) for PC ?

Recycling center, Second hand store, shops that are specialised in video game consoles. There was one in Aachen (in the same street as the 'Volkshochschule', but I'm not sure if it still exists. BTW Atari, Commodore and the early SEGA machines used the same kind of joysticks. But be carefull with the extra funktions on Sega sticks/pads, some shortcircuit power and ground. The SEGA is build to handle that, other computers are not.

Please stand for the National Anthem:

Oh, say can you see by dawn's early light
What so proudly we hailed at the twilight's last gleaming?
Whose broad stripes and bright stars through the perilous fight
O'er the ramparts we watched were so gallantly streaming?
And the rockets' red glare, the bombs bursting in air,
Gave proof through the night that our flag was still there.
Oh, say does that star-spangled banner yet wave
O'er the land of the free and the home of the brave?

Thank you. You may resume your seat.

3216. Re: MIO Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-28 02:09:28 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d1bc550$0$3577$272ea4a1@news.execpc.com>
Source record: 28987

I have a 1 meg MIO that came with a 9.3VDC ps.
My 256k one works on a standard 9VAC.
It is my understanding all MIOs have a rectifier that converts
the 9VAC to some DC voltage, and that a 9VDC supply just
isn't using the rectifier. I've never tried plugging the 9VAC
into the 1 meg MIO, just not that much risk taking for just curiositie's
sake.
I would guess if you tried your 9VDC on the MIO that doesn't work,
the MIO is the problem, not the ps. I don't think it would hurt to
plug a 9VAC into it, but just the thought makes me nervous, AC
and DC can burn up units if the wrong supply is used, eg. I've blown
the fuse on a 9VAC Atari brick plugging it into an Indus, and feel lucky
I haven't made the reverse, plugging the 12VDC, or whatever the Indus
takes, into a 1050.

3217. What I did today (A8)

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-28 02:16:30 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d1bc6f4$0$3573$272ea4a1@news.execpc.com>
Source record: 28988

I gave a kid a 800XL, two Indus drives and cables and power supplies,
except the monitor cable, told him he could get one at Radio Shack.
Him and his Dad couldn't find one, so I went with him to RS.
Nope, no 5 pin DIN to RCA.
We bought a midi cable and some RCA plugs.
It worked! I got lucky because the bottom pin (#3 counting clockwise,
the bottom one) is ground on both the Atari and the midi. The
composite and audio were easy enough, but if the ground hadn't
been that bottom pin, I can't figure how I coulda made it work.
The moral, you can use a MIDI cable to make a monitor cable.
(The MIDI cable, at least this one, has all four wires and a ground, so
it could be used to make a S-Video on A8s that have separate
lumina and chroma.)

Hey Ben, I took the bait and visited your web page. Doesn't that Atari have a grammer and spell checker on it? It would certainly look a lot more professional if you used it.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

It lets you put more than one bootable disk program on one disk. It also has a boot menu along with utilities to add or remove programs. Good for conserving disk space with alot of little bootable programs.
Mo

Ben didn't write the message you quoted.

The message you responded to was cowardly attempt to dump on Ben. Maybe my comment is a bit harsh, lets just say the individual was having a monthly pms attack.

IMO you should look for 'Mapping The Atari' which is the original source of information. Some additional info, like undocumented opcodes can be found on the net (e.g. http://members.chello.nl/taf.offenga/atari.htm).

Freddy.

You found the same thing I did. RS no longer makes the old skool monitor cables for c64 and atari. Instead, I bought one off ebay from some guy who has a truckload of these left. A search on ebay will turn him up...for me, it was easier to buy one of those instead of chopping and reassembling. Could go either way.

Well,
there are quite many demos and intros, that have this song.
there is 1) Hobbytronic demo (1989, 1990, 1991 or 1992), 2) Compyshop
magazine (one mag features this song as an intro!), 3) dozens of polish
demos I do not remember right now... -Andreas.

Well,
if they are GIF pics, try Apacview or Jview from jeff Potter. if they are IFF/LBM then try ILBMread from jeff Potter. if they are JPEG, then try A8jdpeg from Raphael Espino (monochrome or greyscale only). If you need these converters and cannot find them anywhere - email me to get them 1-2 weeks later. if the pics are degas or Degas elite, then try Degasread from jeff Potter or the Degas viewers from Antic and analog (antic and analog viewers are monochrome only). -Andreas.

Hello Dean,
maybe you did not know, but Power per Post also had a magazine in the late 80s called "Atari magazin". there you could find the quick language and sam desktop as so-called type-in-listings. this software also appeared on the lazy finger disks (AM reader disks). the software that has been published in these magazines was version 1.0 - the comercial versions were 1.1, 2.0 and 2.1 (updated versions). Now, all Lazy finger disks have been made PD, thus the older Quick and SAM versions are avaiable as PD stuff now. Maybe you want to give these PD versions as try-out versions to customers who do not want to buy the whole thing at once. If they are satisfied with this PD stuff, maybe they want to purchase the full+updated commercial releases then. I can send you the two PD disks if you are interested, just email me.

By the way, are you accepting Euros right now ?!? And when does the UK join the rest of the EU and use Euros ?? What about euro-cheques - they are very common here in Germany, but I have notseen them in many other european countries...
-Andreas.

P.S.: Power per Post is out of business now, all their rights went to Sascha Roeber, PD-World Versand, Bruch 101, 49635 Badbergen, Germany; KE-soft is also out of business and Sascha has most of these rights too !!

- using interlaced gr. 9+11 mode you will receive 160x100 or 80x200
pixels 8plus some flicker!!)

>

>
> I know it,but these pictures need too much memory.

- use compressed RGB pictures (called Colorviewsquash - it uses
koala/micro illustrator compression and you have only 1 file instead of
3 !!); there is also a viewer available: colorsqashview - both programs
by Clay Halliwell; Jview supports compressed (colorsquash) pics...

>
> I want to use Graphics 15 screens (=4 colours) with DLIs.

- use Jview (GIF), A8jdpeg (JPG) or other programs to create Gr. 15
pictures; then use a good painter or a color tuner to tune in the 4
basic colors; next use a color enhancer like Fun with Arts or similar
programs to enhance the colors with DLIs.

Alas,
it is called ILBMview or as I interpret it: ILBMread, meaning it reads
and shows the pics, but it does not save (thus convert) them. thats very
sad... -Andreas.

P.S.: It supports Gr. 8, 9 and 15;

Well,
what about some strange polish picture formats, like:
INT, INP, XLP, RIP and such ?!? I have some sources for RIP and some
tools and viewers to convert Gr. 15 to INT, INP, XLP (same res., 8-32
colors - interlace!) and to convert BMP and IFF to RIP (gr. 9 + Gr. 10
interlace thats 160x238 pixels with 16x9 colors!). Think thats it so far
- Andreas.

Hello Thomas !! (talking to you in german language would be easier)

Well, one can produce non-interlaced gr9/gr11 pics with apacview (converts gif to apac). very useful is also the colorizer and/or paint 256 (to convert apac into apac-2 format which is equal to paint 256 format); to produce interlaced gr9/gr11 pics, I do not know of a tool that can convert PC/ST/AMI/etc. pics to XL, but there are a couple of XL programs (painting programs) like digipaint and Pryzm that support interlaced gr9/gr11 pics. to me non-interlaced means no flicker, just 62 sectors in length and 80x96 pixels resolution; whereas interlaced means some flicker, 123-124 sectors in length and 160x96 or 80x192 pixels resolution;
most programs are however written on NTSC machines and have some color bugs on PAL machines...

What programs I use for making graphics on the A8?? Actually I never paint or draw anything on the A8 - I am just converting pictures. I love converting things to the A8 (sounds, texts, gfx) just to show what can be done. for converting I use quite many programs - on the PC I use Micrografix Picture Publisher to set the resolution and to tune in the colors; just two examples:

1) A8jdpeg needs very dark greyscale JPG pics to convert them properly to the XL - only with dark pics you get a black background which is best for HIP. Thus when converting to HIP I have to convert JPG into 320x200 and very dark greyscale on the PC;
2) when converting to RGB I have to "pop" up the colors on the PC and make them bright as neon colors, so you can see them on the PAL XL in RGB mode (gr. 15 or gr.9). If I don`t do this, most colors just disappear or fade away, but when I "pop" them up to their extremes (which makes them look very strange on the PC) the colors look very good on the little XL...

On the A8 I use quite many converter programs to convert sounds, grafix and texts, to many to name them here. I have collected them on a few medium/enhanced density disks, if you are interested I can email them to you, as well as some good sample picture disks.

Hmm, sources. since I am not a programmer I almost never have any sources available. think I have some TB programs which show how to load or to convert into gr.9/gr.11 thats all for now. -Andreas.

I've done this before with a C64 and a PC with no problems. I had to
type in ATA on the PC side (to force it to answer). I didn't need
any special simulators or gear between the modems other than the phone
cable.

>I've got a modem (can't remember the model #) for my 8-bit. Can I use a null
>modem cable to transfer my files to the PC?

If you have a standard serial port on the PC, yes. If not, it's
likely that you might have a "WinModem" which is a modem that doesn't
necessarily expose a serial port.

Not. Sparta-Dos updates something in the bootsectors everytime it writes to a disk. When using the PC-mirror feature, there are
no bootsectors. I think there is a solution for this, like emulating the bootsectors in PC-memory. I talked about with Steven
Tucker a long while ago, but he doesn't know that much about the Sparta-Dos disk-structure as he told me...

I would like to point out that I have a license agreement dating back to February 1993 to distribute the English language versions of all the Power Per Post products outside of any German-speaking countries. Initially, the license covered just the UK, but was later extended to any non-German speaking countries, notably Germany and Austria. The deal was organised directly with one of the original authors, namely Harald Shoenfeld. Power Per Post were aware of this, and received royalties. Although Power Per Post are no longer trading, my agreement was never revoked, and in 1999 I made a final block payment to allow me to carry on selling these products without need to pay further royalties. Again, this has not been revoked. I would suspect that the rights transferred to Sascha Roeber are the German language versions. I would also like to point out that I re-wrote the manuals into English, with Harald Schoenfeld translating from German, which was no easy task. I would claim joint copyright on these English versions, because most of the text was written by me in order to create a usable document.

In light of my comments above, I would like to make it clear that as far as I am concerned I have valid licenses to sell these products outside of any German-speaking countries, and I am NOT attempting to break any copyright laws for personal gain. If anybody can provide any documentary evidence to the contrary, then I would like to see that with a view to clearing up any misunderstandings. I would appreciate if this information were sent to me only, and not the whole group.

Dean Garraghty

It doesn't hurt the 1050, and if you're lucky, and your 1050 is not very picky, it may even run on 12VDC. I tried it in my car,
and when the engine is running (voltage goes to 13,8VDC) I could even boot-up my 600XL with the 1050...

Hi there!

Crap... i almost completed a 2048 byte entry for the compo last year,
but this year its a 1024 byte compo!

Will there be a 2048 byte compo soon?

Greetings

Hans

Well, geeeze, if there IS a 2048 byte compo, then I might actually
attempt it this time! For miniature stuff, you guys really kick!
I might even have a chance at 2048 bytes...

What about a halfway compromise, at 3072 bytes?!

Verrry intellesting!
Uhm. I guess Quick is a programing language, and I'm sure this
SAM being referred to isn't the SAM I know (Software Automatic Mouth).
Then there was another product....lazy finger (AM) disks?
There have been a few days, Mr. Garraghty did say Quick programming
language and SAM desktop manager, I forgot.
Good luck to both of you (Andreas and Dean.)
I wonder if this SAM is like the Diamond desktop, which I have
seen a little of, not the commercial Diamond cart.
One person, Mr. Garraghty, but I haven't bought any 8-bit software
for some time, unless you would include APE and Imagic registration.
I did buy a Sparta X cart from an individual a few years back.
I'm sure there are some titles Mr. Garraghty has that I'm not familiar
with, specifically some UK commercial games.
I'm pretty satiated, but still enjoy doing things with my Ataris, as
I've shared in some recent posts.
My grandson heard me say I wanted a Bob Woolley 1200XL with
256K memory, clear pic, IDE hard drive and Woolley OS to support
it (built in IDE hard drive). I think I could live without the PBI and
BASIC. Also maybe a Omnimon OS in there or some ml monitor.
My most recent A8 related purchase was a kid's actually paid for
midi cable and RCA plugs to make a composite cable.
Oh, my grandson, he is now bugging me to make this 1200XL and
IF I make two, I can have one.

Naturally I had the same views of writing a small game for the Amstrad, but I'm pretty sure I won't be able to get a sprite routine & a couple of sprites crammed into 1024 bytes. It would have to look more like a man avoiding a bouncing star ('*') if I were to write one.

Would other machines such as the C64 or perhaps Atari have an advantage in that field?

From what I know the Atari 8bit computer are supposed to have access to 256 colours (don't know if they are accessable in BASIC) which if that statement were true would leave the other machines for dead! ;-)

Then that leaves the Spectrum which could pull of anything (& catch everyone off guard)!

Regards,
Ross.

"Ron Hamilton" wrote

> Does APE not use standard ATR files?

Yes, APE is compatible with the native (SIO2PC) ATR images, but besides of that, you can enable a PC-mirror drive withing APE.
With PC-Mirror you can read files directly from your PC harddisk. It has some limitations, like only the first 64 files will be
listed (127 on Sparta, 1023 with SDX) when asking for a directory. You can change directories by just "loading" the directory.
Since this is a zero-byte file, a standard SIO-error will be generated, and APE takes advantage of this generated error-number by
changing to the directory.

Note: you can also write to the PC-Mirror with about any DOS 2.x compatible DOS, including MyDos, but not Sparta...

> The boot sectors are usually numbers 1,
> 2 & 3 and would normally be present. What format does the PC-Mirror option

Close to the DOS 2.5 like structure.

No, but it's the same 600XL that will be build into the hearse. b.t.w. I finally made some pics of the car.

> I'm still looking for
> the right wagon for myself, when I find it- I'll know it!

A hearse has plenty of space and is way more fun then just a van. It has some disadvantages, like parking problems (the average
car over here is about 4 meter in lenght, while the hearse is 6,45 meters) and with our prices of gas, driving it is very
expensive, but what the heck...

Err, a mode 0 character-sized sprite is 4 by 8 bytes = 32 bytes, under 50
bytes for a sprite routine (XOR sprite, so you just print it again to delete
it).... no big deal :-)

I'll have to dig up some AA's to have a look at this. My only concern is I want a good guy & a nasty character sprite. I'll have to also write something which checks where the goodie is & where the badie is. I thought that maybe easier to do if I used the basic 20x25 grid to establish where the characters are.

David Hall also wrote a program which was in ACU (as a 10-liner) called 'Axiom Sprites' for memory, which I used for an extremely basic shoot-em-up. Only trouble with that was the restriction on the size of the sprite (I think, but not totally sure about) apart from that the supported colour in the sprite was as good as an ordinary sprite.

Regards,
Ross.

I don't remember much about Atari programming, but on my Atari XE I used to frequently use a graphics mode in BASIC which allowed me either 64 or 128 shades of a single color - red, green, or blue - or as many shades of grayscale. It was very useful for my experiments with fractals and raytracing. (Yes, raytracing. I was actually producing lighted, texture-mapped objects with reflection and refraction on an 8-bit Atari in BASIC! I wrote a great fractal zoomer too, with tons of optimizations to make the render time bearable.)

Cheers,
Michael

This isn't strictly true, as you require the game to "start with RUN
from the basic prompt." So you could have exactly 1k of Z80 as your
executable, but still not be conforming to the rules.

I did some research into this (by digging up some of my old computer catalogues) & found one program which was written for an Atari (unfortunately it doesn't go into which model micro, but it sounds like something for the 400 or 800 series machines) which demonstrates the ability of having 256 colours on the screen at one (as opposed to having 16 colours on the screen at once @ 320x192).

Unfortunately, the only pitfall about that program is the screen resolution is dropped down to 80x96 & requires consumes a bit of space if anyone did want it as well as the copy I have in this magazine seems to look incomplete! Bad Show fellas :-(

Still, 16 colours on screen out of a possible 256 selections is pretty good considering my machine can manage max 16 colours out of 27! (But I've lived with it happily like that!)

Incidentally I'm not too sure about the full capabilities of the Atari XE (I'll check out oldcomputers.com museum which will refresh me of course), however I do believe that my Atari 7800 is the console equivalent of the Atari XE & from what I have to go by, there are some pretty serious graphics/colour capabilities which it can accomplish.

Regards,
Ross.

Nah, the CPC+ can run rings round it. So can the SAM Coupe, probably.

Howdy Mo, folks

> Also, the PC's modem must be set to the same speed as the ataris probably
> 300baud, 8bit,no parity.

If your gonna use modems, check the fastest speed the one on the Atari side
will go using the hardware you have on the Atari side. (850's will do 19.2
kbs, but without hardware handshake. Try it out. The lines are short.)
No need to restrict yourself to 300 baud if your modem can go way faster.

If your using a null-modem cable (no modems), handshaking is often not
needed. (or so I've heard)

I don't see how that contradicts the above statement. You're allowed
to use any language you want, the only restriction is the size of the
executable (including all headers, data, etc). To keep things simple
the requirement is that the executable should start in the standard
way on the platform, usually RUN from the basic prompt. On a CP/M
machine the requirement would be that the executable would start from
the command line, in GEOS by clicking on its icon, etc.

They probably can, but you're not really comparing like with like...

The Atari 8-bit line was released in 1979, compared to 1990 for the CPC+ and
1992 for the SAM. Considering it's at least 10 years older it can certainly
give some of the newer 8-bit machines a run or their money.

Actually, the SAM predates the CPC+ and was release in 1989. I had one
of the first.

The Enterprise kicks both of their asses, anyway - the CPC thoroughly,
and the SAM by way of being four years older (actually, five, but the
time taken to get the design finalised...).

3275. Ben Poehland v. Micromiser Software

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-01 22:01:22 UTC
From: Steve Thornton <steve@micromiser.com>
Message-ID: <3d20d080$0$38743$45beb828@newscene.com>
Source record: 29046

To: Everyone
From: Steve Thornton, Pres.
Micromiser Software

In 1993 - 1994, Ben Poehland posted several messages to this group trashing me personally, though still saying some nice things about our software. Since it looks like these messages will come up forever, I need to post my side of this story.

I first became aware of these messages a few years ago. I attempted a search for a way to contact Ben so that possibly we could straighten this out between us, now that we are older and wiser. I did not find a way, though I didn't spend a lot of time.

Long after the 8-bit Atari market was dead, long after having sold or receiving any support requests for 8-bit software, and long after I had forgotten about these 8-bit products, I received a call from Ben. He informed me that one program, Turbofile, was a great program and that a lot of loyal 8-bit Atari users would still like to use it. This was news to me, but of course I was flattered.

Ben wondered if he could acquire the rights, etc. to the program and distribute it, including as I recall, the source files. Well the "rights" were worth zero to anyone at that time. But I wanted to be compensated for my time to dust off one of the 8-bits to see if it would still work, find the disks in the garage, find the disks with the latest source files, and see if I could put something together that would still work as intended. Even fixing the one bug ever found in that program (but for which there was a work-around).

I estimated the hours this would take and gave Ben a figure based on these hours X my support rate at that time. That amounted to $600 or $800 as I recall, but could have been half or double that. In any case, that was fine with him. I don't know if Ben said at that point that he would like me to sign a contract, but if he did I would have said Ok.

I then spent a few hours dusting of the Ataris, etc., and finding all the resources for this program and verifying that I had something that would work. I think part the time I had estimated included commenting source files. I assume so because it wouldn't be worth much without those. These 8-bit programs were all cryptic as hell trying to jam everything into 32K, and comments gobbled too much room to be included in the source code. Of course the code read like English to me at the time I was still supporting it. I would need to create a separate file for this. Well, so far, considering my time I was a few hundred

dollars in the hole already. But I saw in my files that Ben was a customer years before that, and he sounded pretty dedicated and legit to me, so no problem.

As I recall, I next received a contract that no software developer in their right mind would sign. Ben had spent days writing this, according to him, and I'm sure everything sounded perfectly reasonable to him. But Micromiser would have legal liabilities. I don't recall anything like the limits of liability you see all the time in software, like limiting incidental and consequential damages, etc. I think there were one or two other problems, i.e. some sort of liability for Micromiser, which I would have addressed, but can't remember. In any case, our deal did not compensate Micromiser for any liability, or any time beyond the activities I've described. After the exchange of resources, that was supposed to be the end of it. If there were no contract, it wouldn't have been an issue. But Ben wanted a contract, and that made it an issue.

Well, the part about the contract was fine with me, though I had never had a contract for anything this minor before. I could understand how Ben would worry about this or that, as it seemed the first time for him. By that time I had run a home building business, a Nightclub, and a software company. I had lots of experience with contracts. In any original contract for one particular deal, it is routine and expected for it to go back and forth a number of times, as any lawyer or experienced business operator will tell you. (It was apparent to me that Ben was neither, though I can't know for sure). So I made a few changes or added provisions (I think Ben said three or so), and sent it back. It may have gone back and forth one more time, I can't remember. Now by this time, I'm more hours in the hole on this deal, but that's ok, everything's going along nicely in my mind.

Then, as I recall, I received a letter (or whatever) that amounted to a tirade from Ben about how great his contract was, how much time he spent on it, and how (pick any nasty word you like) I was to question it or want to change it. And if it did go back and forth a second time, he wanted to revert to the original and have me sign it with no changes whatsoever -- that part I will never forget.

Well, I don't know if I got steamed at this point, but I don't think I did. But one thing was for sure: I wasn't going to sign that original contract and then worry about lawsuits (or whatever other liability) from then on - with no compensation for same. Well, that was it for Ben too, because he evidently wasn't going to do business unless I signed his contract, in his words, without making any changes. Fat chance of me, or any business owner anywhere, of ever doing that. Ask any lawyer. This is just not how you do business.

Ok, at that point or shortly thereafter I was steamed. I had spent a lot of time, and had considerable enthusiasm, only to find out I had to sign this contract written by an amateur without being able to revise anything or add any provisions of my own. That was the end of

the matter for me. I wouldn't communicate with Ben on any subject after that, just more wasted time in my mind. Whether words were said, I can't remember. I don't think I said anything to make the situation (and I'm sure Ben would have mentioned it if I did).

Ben has also posted that Micromiser had an agreement with ICD. What I had was a phone conversation with Tom Harker where he said, Ok go ahead and send one of those SpartDOS files out, no big deal. It was very casual and I trusted Tom to remember it and not to go back on it. Well, there was no reason for him too. I explained that to Ben. This is one thing I remember. It was clear that if he needed that file, and if he needed assurance about it, he would have to contact Tom himself. Now that I think about it, this may have been one of the provisions that I couldn't accept, i.e. obligating ICD to something.

I'm recalling this as best I can. That was many years ago. But the substance of it is correct, and if you read Ben's own posts carefully, you'll see I had no motive to act as he says, but quite to the contrary. He says himself that he worked for a week on a contract that I would not sign. That alone should be enough for anyone with business experience to see the problem originating at his end.

I would like to point out that all messages from all posters were generally complimentary to both our software, support, and myself, including reviews (as I recall) specifically praising our support, which is and always has been our hallmark. Thank you!

I would also like to thank every 8-bit Atari user everywhere for using our products, and for so long! It is a great feeling! Believe me when I say I had no idea whatever that so many people still had an interest☐ in our products as late as 1994. I would have taken a lot better care of those disks. But I had no such feedback, and was not reading newsgroups at the time.

Also, if there is any Atari user anywhere still using one of our Atari products, copy them freely and do whatever you like with them! They make great frisbees too! I would have said this in 1994 as well if I had known about the persistent interest. Though I still would have charged for support time if that was required.

Thanks for reading my piece. Ben, if you're out there, I sincerely apologize for anything I said that offended you. Believe me it was not my intention. I would like to make up with you if that is possible.

Steve Thornton, Pres.
Micromiser Software

I stand corrected. Blame http://www.8bit.computingmuseum.com/ as I took the
dates from them without thinking about it. Still, even in 1989 the Atari 8
bit machines had been out for a decade.

Yep, I liked the keyboard design, and the hardware appeared to be pretty damn good as well. Shame that it was delayed and released late otherwise it would have had some success I am sure.

The CPC+ was a cost-reduced CPC with extra features. It might have been made in 1990 or whenever, but the featureset could have been done many years earlier if Amstrad hadn't been messing around with the Spectrum and had invested some time in making a computer to compete with the Atari and Amiga in the late 80's and early 90's.

Which Version of BASIC do you have?
There are three versions of Atari BASIC for the 8-Bit computers. The 400 and 800 used either Version A or B on cartridge, the 800XL had basic built-in (usually Version B), and the 130XE had Version C built-in. Version C was also available on cartridge for the earlier models. You might be wondering how to tell which version you have, especially if it's on a cartridge. Here is some simple code to help, and of course, (don't forget to plug your BASIC cartridge into the left slot)...

```
PRINT PEEK(43234)
```

If the result is 162 then you have Version A
If the result is 96 then you have Version B
If the result is 234, you have Version C

Yes, I think I've got the sprites thing worked out. As to doing it on
a Plus, we don't have 'real' Plus machines here in Aust. (the original
should work just fine though).

probably.

Ah yes, I've seen what everyone else has to say & agree with them in
some shape or form. I don't know much about the SAM Coupe (except for
what others have mentioned about it from this thread), but the Atari
sure well pre-dates those. Anyway I was merely saying that in it's day
the Atari was a very serious machine in terms of graphics & colour.

The only pitfall the CPC+ has (in terms of producing the 4096 colours)
is extra routines need to be written to access it. I think the Atari
could easily display 16 of any of the 256 colours in one go (via basic
commands!).

And because this is a competition for producing an 1k game the less
code is probably the better (as the Plus requires more code to access
the extra colours).

Anyway for what I'm doing maybe tricky to do, but the good thing I can
see about this program is the final product should have a common set
of instructions for running the game (in which various variables will
be changed to make it harder).

Also too, if anyone here had a computer like the Jupiter Ace & wished
to write a game for the competition should be perfectly welcomed to
(there's even an emulator for it too which is reasonably easy to use
once one has read the small manual!).

The Jupiter Ace is just another 8bit (it probably has no advantages)
except that it's one of the few computer systems (if not the only)
which uses Forth (instead of BASIC!) as standard.

However it maybe interesting to see how they work out the size of the
program! (probably by working out the size of the file which the
emulator uses).

Regards,
Ross.

The Enterprise is grey with a green/grey/blue keyboard - and in place of
cursor keys, a little joystick. Very good for text editing, as it
happens. Technically, it had very versatile graphics, decent sound,
excellent OS, 4Mb RAM capability, and grew to fit your desk as you
expanded it.

I've had two, but I can't remember the exact specs. The was an emulator
kicking about.

Cool. And of course the original should be up to the job, the CPC can more
than compete with those other pesky 8-bits...

Oh well of course. I was just pointing out that there are a few other 8
bits that can do some really quite stunning stuff, even in 1024 bytes. I
should imagine the Gamboy Color could as well, though I've never
programmed for it.

You only need about 30 bytes of assembly. And the savings made from having
hardware sprites rather than needing assembly sprite routines should
easily make up for that.

Well good luck with it. I might have a bash at doing something myself this
year. Although I did keep saying that last time...

Well yeah, it's got a pretty reasonable BASIC to go with it.

Ah, yeah. I suppose you could also say that each machine has it's
strengths & weaknesses (which counts for the time & the cirstances for
which they were introduced).

Ah okay. I wasn't too sure if Hardware sprite created more room or
less (now I know!) :-)

I just hope it isn't something which is compared to Count Duckula 2!
:-)

In last years competition I thought Richard Wilson's efforts were
quite good (particularly the 2k Invaders), I should think the
programming team who wrote the original Space Invaders arcade game
back in '78 would marvel at something which just uses 2k! :-)

I've put a sprite routine on my website which I think will do the job
for you. There's a sprite definer there as well (Easi-Sprite Definer
which appeared on an AA covertape). I created a cut-down version of
the sprite code for my book and that will do the job. I seem to
remember it being just a few lines of code, but I can't remember now
and can't easily check it. For more information, see:
http://www.sean.co.uk/a/amstrad/amstrad8.shtm
The software is available to download in dsk format.

You're welcome to use it. A credit and/or link would be appreciated.

Thanks,
Sean

The original Space Invaders arcade uses a total of four 2K eproms, and
it even includes samples for the explosions.

The mention of Ben's name in this newsgroup got me curious.

Ben and I had a correspondence of sorts going during the AC days and for a short time thereafter. I reconnected with him briefly when I retired and started to volunteer for an agency that helps people with developmental disabilities. He was working for a company that produced talking devices for people with visual problems. But he kind of let it be known that he wanted to steer clear of the Atari community. Then he changed his ISP and we lost contact.

Has anyone been in contact with Ben in the past year?

Thanks.

Alan

3295. Ben Poehland v. Micromiser Software

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-02 18:37:08 UTC
From: Steve Thornton <steve@micromiser.com>
Message-ID: <3d21f289$0$92370$45beb828@newscene.com>
Source record: 28866

Hi Russ, Paul, Mathy,

I can't believe you guys are still using those 8-bits including these
Micromiser programs. But of course that's great!

Besides the 8-bit programs Turbobase, Turbofile, Turboword being
completely in the public domain, this also applies to a program
for the ST called Ultrabase. Do anything you want with these
programs, disks, etc.

By the way, from 1985 thru about 1997 (??) a company in Orlando,
Ace Rubber Stamp, used Turbobase on three
8-bit Ataris on a sneaker network, and were very happy with it
thoughout! One was a point-of-sale station, and customers would
marvel at this setup. They weren't hobbyists either - just saving
money and not upgrading while what they had worked fine. Invoicing,
receivables, billing statements, etc.

I can't remember if any programs require SpartaDOS. As best I recall
they don't. I think SpartDOS gave you more disk capacity like
a whopping 180k or something (see how vague I am on this).
I think that would only have been a big issue with Turbobase.
Then I recall something about a 256K ramdrive - yes that was
the big thing, from ICD.

That 32K was mostly used up with background stuff, so you had like
an 8K slice to move this big program through a piece at a time. So
the ramdrive would be the key. It was a programming nightmare but
also a great challenge and a lot of fun!

I'm sorry Ben Poehland is gone from the Atari community. For the record,
I think he was honest and well-intentioned with me, and didn't post any
facts that were untrue. I wouldn't want our little problem to take away
from his general contributions, which I think kept Atari going longer
that it would have otherwise. The more I think about it, I keep coming
back to that thing with ICD where I had verbal permission to send
some files, and couldn't transfer that to him in any legal
way, and I think at some point he decided that was crucial. The rest
was probably just a result of that frustration. But whatever file(s)
those were, they could be gotten off any SpartDOS disk.

>by Clay Halliwell; Jview supports compressed (colorsquash) pics...

I don't know where this rumor got started. ColorViewSquash does not use the
the MicroIllustrator compression routine. It uses a relatively simple
RLE-style encoding of all three RGB layers simultaneously, scanning
vertically instead of horizontally (since there's more likely to be
repetition in that direction with a 80x192 image). I had planned to support
interlace encoding eventually (for better compression of dithered images),
but like so many other things it got pushed off the to-do list.

Anyway, the encoding format is described in some detail in the CVS
readme.txt.

Thanks Ross,

The original can be downloaded from NVG. I think it's called Electro Invaders or CPC Invaders. It is somewhere around 6K including 2 player mode, mothership, intro screen and its own font. Had to chop out a lot of features to get it down to 2K.

I am planning on doing a couple of entries in the 1K compo. One horizontally scrolling Shoot-Em-Up in fact.

Richard

Ah, okay! Sounds like it's still smaller than the original arcade
game.

> I am planning on doing a couple of entries in the 1K compo. One
> horizontally scrolling Shoot-Em-Up in fact.

Yeah, I had a Shoot-Em-Up (which I wrote a while back too) which was
based on a 10-liner in ACU (except I changed the program to use
Sprites), but as Nich described the original program perfectly as
slowing down when more bullets are fired & a poor collision detection
system. If I were to send it in I would only be sending in another sad
sorry program based on a poor quality program.

In honest opinion, I think doing a shoot-em-up in assembly is the
proper way of writing one, BASIC has the sort of limitations which
could bog things down.

Anyway good luck with those efforts.

Regards,
Ross.

I think you're missing the point. You have a restriction on the way
the executable is started which made "as long as the executable is no
more than 1024 bytes" false, and I pointed this out with my "exactly
1k of Z80 as your executable" example. But this is fairly pedantic I
s'pose.

What I think you need to define is what "headers, data, etc" really
means. For a speccy game, would it be the size of the TAP/TZX file?

> the requirement is that the executable should start in the standard
> way on the platform, usually RUN from the basic prompt. On a CP/M

That isn't really the standard approach on the Spectrum, usually you'd
have an auto-running Basic program (these don't need RUN, they run
directly after loading).

Yes, that worked! Both my 600XL and the 800XL have version B, the
cartridge I have is version A. I can't seem to find a prompt to try the
1200XL...does it not have built-in basic?

Thanks for the help,

The 1200XL like the original 800 and 400's doesn't have Basic built in, you need a Basic cart for it.

I've got an opinion on this, my opinion is wrong to 95% of Atari users.
(No, 1200XL doesn't have built in BASIC.)
B is a re-compile of A. C is a 12 byte patch to B.
I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot.
I must admit I don't have very much experience with C as I go back
to B after using C for a short time.
I prefer B. I know it's foibles. Just LIST, NEW, ENTER, SAVE
every 5 or 6 SAVEs. Also, 0 REM will help with ENTERs that
aren't working (put a immediate 0 REM line before you ENTER.)
Finally, Jindroush Kubec and I have programs that will retrieve unLOADable
SAVEd files that crash upon trying to LOAD or RUN.

On the C64, a BASIC bootstrap stub into ML takes about 12 bytes at the start of the program in order to make it RUNnable. How many bytes would the Spectrum loader take? As the rules stand right now, I'd think that any bootstrap code or program would be included in the 1024-byte limit. The whole point is to get the entire package in 1k. If somebody wanted to submit an entry written in BASIC, it wouldn't have that overhead on either platform.

I too did ben poehlands supervideo on a 600xl, mainly cause I needed to
connect it to a monitor at the time (was back in 1993). A friend also helped
me upgrade it to 64k internally as well. that machine served my dad well as
his first computer for several years

3309. Help! Unable to get "Decision in the Desert" to work.

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-04 03:14:43 UTC
From: Mark Fisher <thefootballcoach@attbi.com>
Message-ID: <D4PU8.403722$cQ3.27715@sccrnsc01>
Source record: 28880

Hi all. I have various versions of Atari800Win, Atari800WinPro, and the OS ROMS, and cannot get this great game to work. I have the .atr files from two different sources. I have my old Atari instruction book with the op. codes and can unlock the game, but it freezes up at the start page, with a blinking curser. The other two games in the series, "Crusade in Europe", and "Conflict in Vietnam" both work great, but "Decision" was always my favorite!

I have a 400 Celeron and Win 98 1st Ed, 192 MB RAM. I also have the original Atari floppy of the game (not used in 13 years and kept in storage, so I don't know if it works). I have an old 486 with a 5 1/4" floppy drive too! But, the CD ROM drive is broken, and it is not detecting the sound card now (this has happened before). My old Atari system is in storage, but one of the 2 power sources is broken, and I'm not sure I can find the old part that goes on the back of the TV to connect to as a monitor, or even if these are still sold. I'd love to play this great game again - it's so much better than Panzer General II IMHO. Anyone have any ideas? Could I somehow make a new .atr file from the original? Is there a setting I am missing? A reliable source of the .atr file? A way to convert this file into something more workable? Thanks. Mark.

3310. BASIC XE and extended memory

Newsgroup: comp.sys.atari.8bit

> Micromiser programs. But of course that's great!

I don't have your software, but I liked what the ads said.
How about this one, my XEGS has 1MB (I'm still working to get the kinks out of this. It's my own design. No loss of software control over anything Atari once stuffed in there and no funky addresses. For now, it only works on my XEGS). On my other XE's I'm using a BlackBox with FloppyBoard to access: 2 3.5" drives, 1 5.25" drive, 1 80MB harddisk, 1 ZIP drive and 1 CD-ROM. I can really read data CD's yet, but there is software that will play Audio CD's. Check out my site at
http://www-users.rwth-aachen.de/mathy.van_nisselroy

Can it use any kind of RAMdisk? Does your software auto detect the size and bank sequence of the available RAM?
It's a good thing it doesn't need SpartaDOS, as I don't like it.

CU Mathy van Nisselroy

PS thanks again for releasing your software into the Public Domain. If you find source code or whatever, I'ld be happy to put it on my website.

(need BASIC cart for 800, 400, 1200XL.)
BASIC is a fairly easy binary load. I imagine it is available at
spudster. (No, I don't think so.) Long ago, I dumped BASICs
I have all there as binary load files. Just move the display list down
under $A000 and load BASIC to $A000-$BFFF and run at $A000.
If I recall.
I use a binary load BASIC in emulators as well, makes it easy
to boot without BASIC, but use BASIC if you want to.

I have to agree with this statement. I've tried a wide arrangement of
Atari computers... Most of the Atari 8-bits (with the exception of the
1200, 1400 and 1450), and I've tried a good lot of the ST world as
well (520ST - Falcon) And I have to say, the Atari 8-bit line was
great from the START!

To matter the fact, I think the 800 is the coolest computer ever.
;)

This has no obvious relevance to what I was saying there, unless I've missed something. Whether a Basic program happens to auto-run or not wouldn't seem to have anything to do with running machine code.

But FWIW, if you put the m/c in a REM statement and make an assumption about the value of PROG (so e.g. it wouldn't work if a Microdrive was connected), I think the overhead is 38 bytes. This is including the (in context) unavoidable 17-byte tape header.

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D25DCC7.6E6513E@students.uni-mainz.de>
Source record: 28894

Hello Clay,
and still I believe I have the original docs which say something like
you used Koala / Micro Illustrator compression because you a) could not
do any better (concerning compression methods and programming
cababilities) and b) the Atari could uncompress this very fast and would
not need minutes or hours like with other compression methods. Ok, this
is not a quote, just what I remember I read in the docs. Will read them
asap at home.

Before I forget: Both colorview-squash and colorsquash-view are great
and very well done. in the last three days I have again converted some
manga pics into Gr. 15 RGB using Apacview and your programs. apacviews
does much better (color) results on a PAL machine than Jview (I do not
know why), thats why I use Apacview and then Colorview-squash to
compress the pictures. By the way, is it still possible to register
these programs (no updated needed - except if you program them in
Assembler!) ?!? Well, I wanted to register all programs from Jeff
Potter some years ago, but he told me there would be no need to do so,
because he no longer supports the atari scene (with updates) nor uses
his atari computer (if I recall this correctly).

You should know, even nowadays with internet, email and many other
things it still takes a while to get or use certain atari programs. when
I read "shareware - please register" the next step is to look for the
copyright notice and quite often I see that its 5 or more years ago, so
I can not be sure if the given adress is still valid or if the
programmer still supports the atari scene or if he still wants the
registration fee. so far I have paid quite some registration fees, but
in the last five years almost none, because most programmers already
disappeared or something like that. so, to cut a long story short, if
you still accept any registration fee, let me know. need your adress
then... -Andreas.

3326. Writing .atr images to Atari format using PC drive

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-06 06:13:27 UTC
From: Voitek Wojcik <voitek@austin.rr.com>
Message-ID: <bUvV8.47156$p85.1407146@twister.austin.rr.com>
Source record: 28897

I recently acquired a 800XL. It came with some old disks, and the majority no longer works. I was wondering if I could copy some of the (abundant) .atr images available all over the Internet onto SDDD or SSDD disks using my 1.2M floppy drive. I've searched for information and utilities to do this, but so far haven't been able to even read an Atari disk, or write anything using my floppy drive that my 1050 would recognize. Most preferably, what I want to do is to take an .atr image file and then write a bootable version of it using my 1.2M on either a SDDD or SSDD floppy--is this doable?

It's doable, but not the way you imagined. You need a 1050toPC cable also known as a PROSYS cable. You use it to connect an Atari 1050 drive to the serial port on your PC and along with some fabulous shareware from Steven Tucker, you'll be burnin floppies in no time. For the software and the cable do a search on APE cable or check Ebay. I lost the APE url maybe someone else can post it.
Mo

I'm working on a one or two level Manic Miner game in 1k for the CPC.

I've got 4 uncompressed sprites, the sprite plotter and the level data
into 1K.

Unfortunatly, I've run out of space already. I can reduce some of the data
with
compression, and fit some of the information into the CPC file header, but
it will
be a close call. At the moment the sprites are 4 bytes wide and 16 lines
tall in mode 0.
I'm going to reduce them to 2 bytes wide and 8 lines tall and see how they
look.

The sprite plotter will be slow as I will not be able to unroll the loops,
and I have used
the Amstrad's firmware functions to calculate the screen address for
plotting

If I can't get the CPC version then I am sure I can do a 1k Manic Miner
clone
for the CPC+.

> Would other machines such as the C64 or perhaps Atari have an
> advantage in that field?
A little, but a lot of people already know the limitations of each machine,
so I hope, will look at the game taking that into account.

BTW, I wrote a 'Burnin Rubber' clone, in under 1k, for the CPC+, would it be
cheating
if I submitted it? The code?
10 |GAME

Seriously, I may dissassemble the built in cartridge game of the CPC+
(Burnin Rubber') and
see if I can use any of the routines in my own 1k game. I believe this is
within the rules?

> From what I know the Atari 8bit computer are supposed to have access
> to 256 colours (don't know if they are accessable in BASIC) which if

> that statement were true would leave the other machines for dead! ;-)
not really. The game could be very nice and colourful, but shit!

Maybe you should concentrate on making the 1k game, and seeing how good you can make it.
If you don't win this time, (and I don't expect to win BTW), then you can try next time.

As for ideas for 1k games, I was considering:
Puzznic, Tetris, some puzzle/card games.. there are a few.
BTW, the Amstrad CPC firmware is your friend, but only for 1K competitions! ;)

Regards,
Kev

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

CPC+
> (Burnin Rubber') and
> see if I can use any of the routines in my own 1k game. I believe
this is
> within the rules?

I suppose it's no different than accessing "the firmware" routines in
a normal CPC. But I'm not entirely sure.

But naturally the CPC+ has access to catridge technology as well does
the C64 & Atari, I not entirely sure if the Spectrum's have them or
not.

If it were that they had the same level of access through things on it
as the CPC+ does then it maybe within the rules, otherwise it unfair
towards the others.

> > From what I know the Atari 8bit computer are supposed to have

Still, with it's 'underdog' status it may take the honors! :-)

The way I see it the Atari XE which maybe comparable to the Amstrad
was the last 8 bitter before Atari shortly dumped it for the Atari ST
range of 16 Bitters & doesn't appear to have anything crappy looking
about it.

> Maybe you should concentrate on making the 1k game, and seeing how
good you

Well, it's just a matter of waiting and seeing.

> As for ideas for 1k games, I was considering:
> Puzznic, Tetris, some puzzle/card games.. there are a few.
> BTW, the Amstrad CPC firmware is your friend, but only for 1K
competitions!
> ;)

Just out of interest, I was curious about this information in the file header business (or is that something I shouldn't know about). Is there any information at any of the Amstrad sites (save the hassle of writing it all down) about this?

I thought I might be able to save some room by using a small assembly routine which sets up all of the colours & if there were a way to store the colour values in the header...

Regards,
Ross.

3331. "Mule" game and cable pinout?

Newsgroup: comp.sys.atari.8bit

Source record: 28902

Hello everyone. I had an Atari 800XL computer years ago I felt like hooking up lately and it seems to have vanished from my attic. I'm looking around trying to find an 800XL, disk drive, monitor, etc. I remember a game called "Mule" I used to play on it a lot. Anybody have any idea where I can get a copy? There's a place I Googled called B&C Computervisions that doesn't have it.

Also, I designed and built a printer interface that would let me use any standard centronics parallel printer with the computer which I DID find. I was going to send it in to Antic or Analog magazines I remember from the time but they were both close to going out of business. Does anyone know ehere I can get one of those funny Atari serial cables and a pinout for it so I can see if my interface still works/

Regards,

Andy

3332. Bin to cartridge ?

Not all binaries will work. The ones that were originally carts and converted to bin load files can be made to work if there isn't a lot of garbage on them.

You would have to strip off the init code, probably something 40 bytes or so, and just burn the actual cart data. On my EPROM burner, I would just load the entire file into memory and look at the code to see what was original and what was added. From there it was relatively easy to specify the memory location to program the EPROM from.

3335. Serial comm questions...

Hello all,

I was just wondering if anyone knows the exact difference between DTE and DCE in terms of serial devices like modems. I have an old voice synth that uses the serial port and although it works as it sits, it has a switch for DCE and DTE. I was just wondering what that may be useful for. Also isn't one of the serial ports on the 850 interface different from the others? If so, can you tell me how different?
Thanks,
Mo

Hum....so what is the first string? Is it something like:

$FF, $FF, $00, $A0, $BF, $FF,<?>, <?>.

Because i've been checking a lot of binaries files and many of them
starts only with the same first three bytes: $FF, $FF, $00.

I just can't wait to make my favorite game in cartridge format: Vanguard.
It's never been ported as a cartridge before.

Thanks for any help! =)

Ooh, a plug for my only web page. ;v)
The significant bytes of Atari load formats (culled years ago, before
there were carts with bank switching) are listed on:
http://members.cox.net/jamesrfr/atari6bb.html

Here's hoping it helps someone besides me. ;vD

Hiya Andreas (and Clay):

I'm still around, and check into this forum every so often. But I haven't used an Atari in 6-8 years. Having fun on a Linux (Mandrake) computer, and on a conventional (MS Windows) PC.

Your 8-bit friend,

Jeff Potter

What James said. $FF $FF is the DOS code for binary file. The next 2 bytes will be the memory area to start loading. The next two bytes will be the end address. Appended to the end of the file are the the start or init address, i.e. where DOS jumps to in memory to start running the file.

With a lot of files there are multiple initiate vectors to do things like lower screen RAM area in memory or maybe put up a graphic on the screen.

If it is bigger then 16k you will have have some problems putting it in the cartridge space.

Source record: 28914

Hi Larry, Both Diskey DD + ED are based on a hackers disk sector editor, they have been around the UK Atari 8-bit pirate/cracking scene, since back in the mid 1980s, i suspect it came via Rob C, Ian K, Livingston Pirare Sqaud groups mainly on either rob c 90k/130k /multiboot 90k/130k /us-alpha-load 180k boot menu disks!

Diskey ED is also better known as Diskey II which originally supported 90k Single Density disks and was rewritten to support 130k Enhanced Density (stock 1050) boot disks.

Diskey DD is also better known as Diskey III, which supports 180k Double Density boot disks, same functionality as diskey II, but two pages per sector up/down cursor keys.

Diskey II + III allows you to edit sectors on unprotected disks,left/right cursor keys = back or next sector, copy sectors from one disk to another, copy sectors from one location to another say 1-50 to 201 - 250 on the same or another disk, extend sectors by adding in more data than the original so you could have `Cracked by you know who' in the program you were hacking, hex shift mask, it allows you to take the atacsii character set an shift it by the hex number entered, such as `ASI' in hs00 could be converted to `!3)' with hs20, find string or hex and etc.

I have used it myself for making cheats in games like more lifes, deactivating the pmgs and etc, if you need any more info let me know, although its about two years since i last used my real Atari 8-bit or emulated 8-bit.

the
> cartridge space.

I've read many articles about that, and there is a way to do 64K or even
128K games with a Atari Super Cartridge like Bug Hunt. Many informations
are on a web site called Atari Cartridge Dumping Project, and i've found a
schematic
# of Bug Hunt and saw that the ROM used in the cart is compatible with a
27512 Eprom
pin to pin. I know there is a way to do 128K games but since there's only
12 (aside the x3
Aprax carts), i won't bother to do a 128K cart.

Now only thing i'm missing is a 27512 Eprom. :)

Many thanks to both of you! =D

> basic progreamme but i cant seem to get it to load.

> ive tried the following:

> LOAD"D0:AUTORUN.SYS"
> BLOAD"D0:AUTORUN.SYS"
> LOAD"D1:AUTORUN.SYS"

You need to get a DOS for the Atari, i.e. check for an ATR containing
Dos 2.5 or something similar. This disk should contain a file named
"DOS.SYS", which contains the file system that will bootstrap the
Basic. Then copy the TurboBasic interpreter as "AUTORUN.SYS" onto the
disk containing the dos.

So long,
Thomas

>I was wondering if I could copy some of the =
>(abundant) .atr images available all over the Internet onto SDDD or SSDD =
>disks using my 1.2M floppy drive.

Yes, but you need to obtain a modification for your 1050 that enables it to use true double-density disks, I use US-Doubler.

That lets you directly transfer double-denisity files (like your disk images, in file form) from the pc to the Atari.

Then run a program on the Atari to convert the disk image file into a proper bootable disk.

I first convert the ATR image into a DCM image, then use ATARIDSK to transfer it to a 5.25" disk that the Atari can read, then use Diskcomm 3.2 on the Atari to convert the DCM image into a new bootable disk. It's a bit convoluted but it works!

Remember to use ordinary double density disks (not 1.2Mb ones) for the transfer and format them on the pc using ATARIDSK, don't format them on the Atari or else the PC won't be able to read them.

Message-ID: <01c22684$3e7838c0$95801f3e@asi>
Source record: 28922

Hi DunxUK, I always found it impossible to transfer files from 180kss pc disk using the 1.2mb 5.25" drive, because it spins @ 360rpm and the Atari drives spin @ 288rpm.

Plus it formats the tracks in 80 track format even if the disk only has forty tracks, thus the tracks are closer together and are incompatible with the Ibmxfer util as it could not read the disk, also all the low density disks i formatted on the 1.2mb drive got knackered with over half the disk full of bad sectors and it could not be reformatted on the 360k drive, because of the 80 trk formula!

I had great number of successful file transfers using a 180kss pc disk in a low density 360k 5.25" pc drive as it spins @ 300rpm.

I used the Ibmxfer program on the backside of the Happy v7.10 utils disk in my Quad 1050 drive (Lazer(Happy 1050 clone), US Duplicator, US Doubler, and stock 1050 modes), but that program would only work with either Happy or Lazer 1050 mod.

What program did you use that works with the US Doubler?

>drives spin @ 288rpm.

Ok, forget about spin speeds as this has no effect on the sectors per track and bytes per sector. Just changes how long the drive takes to write each sector. Trust me it works fine as long as the disk is first formatted on the PC (as the PC needs to align the first sector with the index hole!). Also you can only write to one side of the disk unless your blank disks have two index holes in the jacket. (Little round holes near the middle, not the write-protect notch at the side).

The only thing you cannot do on a PC is make a single or enhanced density disk, it has to be double density, eg 180K per side.

Use ATARIDSK to format the disk on the PC and also to copy your .DCM file(s) to it, from that point on your Atari will have no problems at all reading it as long as;

* you have a double-density mod to the drive, eg US Doubler, Happy etc. *

* you are using software that understands DD disks, eg MyDos, DiskComm etc. *

* you didn't use an HD disk, these always seem to fail with me *

The Atari will read it slowly as the sectors are aligned differently but it /will/ read it.

Then use software on your Atari (I used DiskComm 3.2) to take your DD disk with your DCM file on it and expand it onto a new blank disk (don't worry, DiskComm automatically sorts out the densities).

I've never used IBMXFER so I cannot comment on that, but the setup above definitely works as I use it every week.

Best regards, Dunx

1st question

What version of Atari800win do you have?

2nd question

Have you told it where your roms are under the Atari tab, look in Rom
Images and browse to the roms (I presume you have the needed roms?)

If not then go to http://homepages.paradise.net.nz/atari/emu.html
and get the roms there.

If you are still having probs then let me know and I'll do my best to
get you going.

Btw, someone was asking about Decision in the Desert, I spent ages
trying to get it going with the images I have and I get the same
thing. I presume it's either a bad set of ATR's or it's a pretty rare
non compatible game.

I shall enquire...

3358. Is it possible to change graphics modes mid scanline?

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-08 17:39:37 UTC
From: Dennis Debro <dnsdebro@netzero.net>
Message-ID: <S3kW8.65353$wj4.5668639@e3500-atl2.usenetserver.com>
Source record: 28929

I've thought about this and thought it was possible with a DLI.

Here is the Kernel I was playing with:

```
; Both display lists sit on page boundaries so there is no need to change
the DLISTL
Kernel
pha
tya
pha
ldy #$70
KernelLoop
sta WSYNC ; wait for next scanline
lda #>ANTIC6DisplayList
cpy VCOUNT ; are we at the end of the screen if so the
leave the kernel
bcc ExitKernel
sta DLISTH

lda #>ANTIC2DisplayList
nop ; here waste time before changing
the display list
nop ; I want to load the value at
cycle 36 so it should be
nop ; changed at cycle 38 (mid screen)
nop
nop
nop
nop
nop
nop
nop
nop
sta DLISTH
jmp KernelLoop
ExitKernel
lda #>ANTIC6DisplayList
sta DLISTH
pla
tay
pla
tax
pla
rti
```

Now doing this has no effect on my display. When I add text to the display (each display list has it's own screen RAM location) I get ANTIC6 text. I have all the interrupt values set. I even added break code to make sure it was getting in the routine. Is this even possible with the 8-bit? I guess I don't know exactly how ANTIC processes the display list and screen RAM. There was a case when I checked the DLISTL value it was set to another value other than #$00.

Any help here would be appreciated.

> Any help here would be appreciated.

You've got an extra 'pla tax' at the end of the DLI, but I don't think
that's the problem. I don't think you can change DL modes half way
across a scan line that way (unfortunately).

My understanding is that ANTIC stops the 6502, reads the DL data it
needs, and then starts the 6502 again. Once the DL data has been read
for one (or more depending on graphics mode) scan lines, the DL data
is not read again until just before the next DL instruction is needed.
So changing the DLIST vector won't have an effect until the next line
is read.

The closest you can get is to switch GTIA modes on/off half way across
a scanline using PRIOR (53275, $D01B). So you can start off with a
GR.8 line at the left of the screen, then switch GTIA half way across
and have a GTIA mode along the right hand side of the screen.
Switching the GTIA mode off again before reaching the right edge of
the screen will give you something that looks a lot like GR.15.

The 410 I have doesn't work on its own (no playing) but it does work when it's connected to the computer and running/loading a program. I use it with my language tapes and it works great.

I'm not sure if my player is screwy or if they are all like that and does the 1010 recorder also act this way?

I think that is pictured in the Best Electronics catalog. If it is, it
allowed code to be written on a mini-computer/mainframe, and downloaded
directly into an 800 for testing.....at least, thats what Best said....

Hi Paul. I heard back from Aaron Wheeler, who manages the Holmes Atari site. "decision" is a bad .atr file. I have the original floppy, and an old 486 with a 5 1/4" drive. Can I use Atari800Win or WinPro to create a new .atr or .exe with my disk? As I remember, these games were copy-protected against DOS (you needed 2nd or 3rd generation happy chip I think...)so I can't copy it to a 3 1/2" floppy, but if I can create a new file I will upload it to Holmes' site and anywhere else it is wanted, and we can all play this great game! Thanks. Mark.

Maybe they mispelled it and it was supposed to be "Cromemco". I know they made alot of S-100 stuff in the 80's. Might be an S-100 interface!

There is a version 3.0 that I fished from the net recently. It works much better than the previous version does. There aren't any sound farts and overall, much smoother emulation and more features. I suggest you look for this version.

This is probably due to a bad ROM. I've seen a few corrupted ROMs circulating around the net, specifically the XL ROM. Boot with OS-B for now, but do look for another XL rom from a different site. Post your email here, and I can send you my ROMs and the 3.0 version of the atari800win.

Take care!

Ah, I thought Aaron might know re the ATR (you still resting Aaron ;-)
)

As for the real disk you have 2 options, get APE from Steve Tucker and
make a PRO image which as yet the emulators don't use (C'mon Steve,
pretty please!) or see if Chipmunk etc can deprotect it of the copy
protection and then make a straight ATR with APE which will be
supported by all the emulators.

The emulators themselves won't help in this process..

Righty, that is Rich's last version, there's been a new extension of
Rich's excellent work called Atari800win Plus which has been cleaned
up, added to and contains newer emulator cores so is much more
compatible.

See here for the file

http://atariarea.nostalgia.pl/PLus/index_pl.htm

Could be many things so I'd make a brand new directory, copy the roms
for the emu into it and then unpack the Atari800win Plus in there and
see if that fixes that, Plus now has a setup wizard which helps locate
and config the emu much easier.

See how that goes and let me know..

It's possible it's a bad rom, I would have hoped that would have been
confirmed when I posted the original reply.

Certainly an upgrade to 3.1 would be the best start off option as that
will check the roms for CRC as it stands..

Well, I'm dusting off my Atari 800xl and want to start messing around with it (More than just loading games and playing them) but as I have no manuals, etc. I just don't know where to start. I've found http://www.atariarchives.org which is probably a good place to start, but are there resources (I'm sure there are) for a beginner such as myself to start 're-learning' how to use, program, etc on his 800xl?

I keep hearing about 'black boxes' and using the 8bit computers for more modern applications (reading e-mail, etc) but most of the pages I've found are written for people who already have an 'average user'-level knowledge and some of the stuff starts sounding greek to me :)

Resources of good places to start would be appreciated.

Thanks,

Curtis

Thanks Raphael.

This is what I figured. So switching graphic modes is not possible. What about screen RAM? I would assume ANTIC would work the same way. But wouldn't at least the screen RAM switching have to be possible? If not how would you scroll the left half of the screen and leave the right half stationary?

I reread De Re Atari section on DLIs last night also. I forgot that ANTIC steals time from the 6502.

Again, thanks for the response.

Hi Dunx, thanks for the info, it appears that ATARIDSK is a PC program which read/writes Atari 8bit Mydos180kss disks, which is the exact opposite of IBMXFER as it read/writes PC 180kss disks on the Happy/Lazer 1050 on your Atari, but you could use it on any 8bit dos disk 90k/130k/180k including Spartados, dos 2, Dos2.5 and even Mydos, Never used HD 5.25" disks as i cant get them anyway, pc 180kss disks were formated on the pc in msdos/windows or whatever, i have used this method since 1989.

So maybe its the Happy 1050 IBMXFER that cant read 360k disks formatted 180k on 1.2mb 5.25" floppy and your method dos work on the pc!

Do i format the pc disks or A8 disks on ATARIDSK?

>Do i format the pc disks or A8 disks on ATARIDSK?

Yes since the PC will not be able to read disks formatted on the Atari drive.
PCs use the alignment hole near the hub ring but Ataris (except the XF drive)
ignore them!

As you're in Scotland too email me with your address and I'll get all the
appropriate disks off to you.

Best regards,

Duncan

> about screen RAM? I would assume ANTIC would work the same way. But wouldn't
> at least the screen RAM switching have to be possible? If not how would you
> scroll the left half of the screen and leave the right half stationary?

Sure, you can switch the RAM contents under the feet of the ANTIC, but
what would you gain from doing so? Images located left on the screen
are located in different memory areas than those on the right screen,
hence they are independent from each other in frist place...

Anyhow, there is *one* thing you could do: Adjust the HSCROLL register
mid-screen. IIRC, the effect of doing so was not quite as expected, i.e.
it doesn't scroll the screen only on one half; must be related to some of
the internal ANTIC buffering of the screen.

Greetings,
Thomas

Alright, I downloaded Atari800Win Plus, and everything is working
well, except for the sound. It seems to be running at a much slower
speed than the games. I should probably change something on the sound
menu, but I don't know what.

Mark, drive on over to Hiassoft home page (Ataridsk - WriteATR)
http://www.horus.com/~hias/atari
and give that Atari disk a read with WriteATR, it won't pay much attention
to Atari copy protection methods and then maybe those who know how can
alter the resulting ATR image to break the protection.

Well, myself personally, I'd like to find a copy of the 800xl manual
for my (what else) 800xl

If anyone knows where there's a copy of this online, I'd appreciate it
if they can point me in the right direction.

What is the specs of the PC you using please..

And what DirectX have you installed (if XP then it's 8.1)

A question: Amstrad tape headers are smaller than disc headers (IIRC).
Will a game qualify if it's 1k on tape but larger on disc?

(Otherwise, I suppose I could make it bootable from CP/M 2.2. (-:)

Hi Mathy

Thanks for pointing out such a *great* demo. What a cool idea ! This has to
rate as one of the best demos I've seen in 20 years of Atari !

BTW - This might be a FAQ but is there anyway to transfer a .com (exe) on to
an ATR image. I'd love to run the demo on my real Atari instead of
Atari800Win. I just got through *finaly* building and SIO2PC cable and
bought a registered copy of APE. Now my 256K 800XL is right next to the PC.
I've spent hours playing Rescue on Fractalus (from my original ROM cart)
and my wife now complains about time speant on the Atari instead of the PC
;-)

Be seeing you

Paul

Can someone please explain me this headers thing?

Is there anyway that the size of them can be measured?

I've just been using a standard Header reader to display the size of
them, will that be sufficant enough for working out the size of the
file for this game?

Or will the size of the program be worked out differently?

> (Otherwise, I suppose I could make it bootable from CP/M 2.2. (-:)

There's no reason why you can't use CP/M for this competition. To the
best of my knowledge CP/M '.COM' files don't have headers at all
because all '.com' files start at the same address in memory.

The only downside to CP/M I think is that if your writing any program
in anything else except Assembly it would be too large.

Don't think you can access the Amstrad's Firmware from CP/M either,
but a natural assembly programmer wouldn't need the Firmware (not that
there's anything wrong with the Firmware).

Regards,
Ross.

Here it is. This is what comes with the 800XL as well as a 6-8 page manual that explains things like how to turn it on and how to run diagosis software.

I think that any CPC assembler written game that fits into 1k is going
to rely pretty heavily on the firmware!

It could be a belt or other mechanicals; that Fast Forward should work in
stand alone mode as it is not affected by the motor 'ON' pin.

That sounds like a good application for it actually! There is a demo
written by Our5oft that shows the effect. The GR.8 section has to be
on the left hand side of the screen, if you want GR.8, otherwise you
can toggle GTIA during the horizontal blank to get just the
GR.9/GR.15(ish) effect. Can't remember if it works with GR.10/GR.11
instead of GR.9 or not now.

I do have some code that does it, but it is sat on a disk on the other
side of the world right now. You should be able to easily adapt the
code at the start of this thread to modify PRIOR instead of DLISTH
though.

On a side note, you can also switch ANTIC off and on half way across a
scan line, leaving a "hole" in the picture, can't think of a good use
for it though.

3397. 5200 Version of Wizard of Wor?

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-10 02:46:36 UTC
From: llpwhite@cs.com
Message-ID: <20020709224636.01798.00000052@mb-fu.news.cs.com>
Source record: 28819

I've never owned a 5200, but have noticed that several of the 5200 carts were a little more refined (graphically) than the A8 computer versions. Was there a 5200 version of WOW? Presumably a Roklan release? And if so, did it look any different than the A8 cart? I've always thought that this is one of the most "playable" A8 games ever written, and one of a relatively few that could be 2-player cooperative.
Thanks,
Larry

Well, I've got a grid in GR.8 and want to stick a color image in GR.11
in the middle. Just like those test patterns TV stations use... I suppose
if GR.9 works, GR.10 and 11 should too, since they are jsut a different
value poked in the proper location (64, 128 or 192 instead of 0, IIRC).

Well, anyway it's interesting. Maybe to simulate a viral infection (eating
off portions of the screen)?

IF the game organizers are at ALL sensible, they will have insisted that
the size limit be measured from the game AS FULLY LOADED INTO THE COMPUTER's
MEMORY. Tape drive shenanigans and the like are NOT likely to be looked upon
with a great deal of favor.

> The 410 I have doesn't work on its own (no playing) but it does work when
> it's connected to the computer and running/loading a program.

It only plays when the "motor-on" pin on the sio connector is enabled (+5VDC). Any load instruction on the Atari 8-Bit (LOAD "C:"
, CLOAD , ENTER "C:") will enable it. (as it does with it's SAVE counterparts).

It's the PIA in the Atari which controls this line (PACTL at $D302)

Disable bit 3 to start the cassette motor, enable that bit to stop.

In assembly:

```
;start motor
LDA #$34
STA $D302

; stop motor
LDA #$3C
STA $D302
```

In BASIC:

```
. start motor
POKE 54018,52

. stop motor
POKE 54018,60
```

You will be struggling to find an original copy of MULE. If you do, expect
to pay lots of cash.

A P133 isn't going to run Atari800win Plus 100% perfectly I'd imagine
but the sound problem could be your sound card, if it's an onboard one
then the older ones were not exactly state of the art.

It could also be drivers for the card or a great number of things tbh

You could try playing with the Sound Options in Atari800win plus,
certainly drop the frequency down to 22050 or try 31920, turn OFF
digitised effects as that uses more CPU and helps only a few titles
but can also badly affect the sound too.

Also try adjusting the update advisor, that adjusts how often the
sound is updated (very simple explanation)

If you have a choice between Wave out and Direct Sound in the sound
options then try that also..

Let me know how you get on..

Btw, a general message..There's a new Atari800 DOS out, various
changes in it including a Dirty graphics engine which will help slower
machines and support for the Alphaloads which has already been added
to Plus (not released yet) amongst other nice bits.

Source record: 28830

Howdy folks

To my surprise a saw what looked like a 1200XL keyboard in the movie Legal tender (made in 1997). It was attached to some kind of desk. The characters on screen didn't look like Atari characters. But the key sure looked like the ones on my 800XL, especially the arrows keys. But there were too many silver colored keys in the row on the top, so it must have been a 1200XL (one silver key on the left and a hole bunch on the right, accross the top of the keyboard). I was plesantly surprised to say the least. I've heard of Atari stuff in lots of movies, but this one was new to me. What really surprised me was that the movie wasn't that old yet.

Source record: 28832

Hi Mo,

> I was just wondering if anyone knows the exact difference between
>DTE and DCE in terms of serial devices like modems....

DTE = Data Terminal Equipment
DCE = Data Communications Equipment

The difference between the two is basically in the direction of the various signals, for example on a DTE the "Rx Data" line is an INPUT whereas on a DCE the same line is an OUTPUT.

Therefore, if you're connecting DCE to DTE you use a straight through cable. OTOH, for DCE to DCE or DTE to DTE you'll need a null modem (aka crossover) cable.

The interface on modems is almost always set up as DCE (as it should be). On computers however, whether the interface is set up as DCE or DTE is all too often down to the whim of the manufacturer. It *should* be configured as DTE, but I've seen many machines which are set up as DCE. :-(

TTFN - Pete.

Hi,

Just wanted to say thankyou to everyone in the group who advised me on how to test the Atari system I'm now selling. It was good fun playing some of the old games but space and a lack of time have meant that the system is now up for auction on ebay:

1) Alpha Load modded 1050 disk drive + 100 disks

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1365227068

2) Atari 130XE, Alpha load modded 1050 disk drive + (apprx) 700 disks

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=1365227839

Hopefully someone who has the time to properly archive the games on the disks will win the auction and pass on any gems to the public.

Thanks for reading

John

3415. Free Atari Stuff

I have some old Atari stuff that I do not want any more. It is
currently located in the basement of my parents' house in Orem, Utah.
If you want to go pick it up, it's yours for the taking.

Neither I nor my parents really want to ship this stuff, so if you need
it shipped, please make an offer.

Atari light-gun for XE game system (broken)
Sesame Street Letter Go Round cartridge game
Atari Speed Reading cassettes and book
Atari XDM daisy wheel printer (working at last check, with one extra
printer ribbon)
Star NX 1000 dot-matrix printer with a half box of tractor feed paper
Amber (monochrome) monitor with Atari monitor cable
Atari 1020 color plotter with one roll of paper, no working pens
Atari 410 cassette recorder
Percom disk drive with parallel port
Atari 1027 power supply and manual (no printer)
Ape Face parallel printer adapter

All parts except the light gun were working the last time they were
used, but that was several years ago.

I'm not familiar with that particular film, nor am I a film industry insider; but I do know that the prop departments for films and TV shows frequently dig up all sorts of junk to turn into props. Chances are somebody found a 1200XL for $2 at a garage sale or something and tore it apart just to build a desk with a built-in keyboard. The thing wouldn't need to be functional (except maybe to the extent that the keys could be depressed when the actor typed on it, if that happened in the film). Certainly it's not a big endorsement for Atari. If anything, it's the opposite, given the probable means of acquisition of the keyboard.

Maybe, although there are easier ways of doing that, like using PMGs.
The size of the "hole" is quite big, and you can get a flickering
effect on the right hand side of the hole. Maybe it could be used in
a demo somehow.

> If you switch it back on again, would it read the DLI or use the one it used
> before you switched it off?

The Display List Interrupt itself isn't affected, that just keeps on
going until it hits an RTI. I didn't try changing anything else while
ANTIC was off so I don't know for sure if it re-reads any data, but
I'd guess not. The right hand edge of the screen appears as normal.

Sorry, "tape drive shenanigans"? The Amstrad CPC 464 came with a tape
drive built in. And no disc drive.

And if you made any effort to look at the rules of the competition,
you'd see that the measure of size includes headers, rather than how
much memory it takes "FULLY LOADED INTO THE COMPUTER's MEMORY". Which is
the entire fucking point of this discussion.

IIRC the Data Communication Equipment is at the modem and the Data Terminal Equipment is at your computer. Communication software often liked to report the DTE speed of data transfer as it could be faster than the actual DCE because of compression and decompression performed by the modems. It was not unusual for a 33.6 or 28.8 modem to achieve an effective transfer rate near 57.6 kbs.

3421. Keyboard Is "Stuck"

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-11 00:36:13 UTC
From: Ken Carpenter <ken@helikon.com>
Message-ID: <uipl3651448o4d@corp.supernews.com>
Source record: 28842

I pulled out my old 600XL the other day, and hooked it up to my TV. To my amazement, it powered on and showed me the READY prompt. Then it started typing the same character (forget which) over and over at a rate of about 2 chars per second.

None of the normal keys would respond. The soft function keys, however, did work, so I was able to run the self-test. All tests passed except the keyboard test.

Any idea on what I might try doing to fix it? I realize that I'll have to take it apart, but I have no idea what to do once I've done that!

Thanks!

Ken

The only atari item I saw in a movie in the past few years is that movie "Glitter" (yes the mariah carey movie hardly anybody liked) had an ST setup in a music studio with the sequencers. That in itself blew away the continiuty of that scene since the movie was set in 1983, 2 full years before the first ST was released to the public.

Well, you know what key is stuck. Try banging on that key (maybe tapping).
The plastic rod that pushes down may be stuck. You can pop the
key with a little screwdriver, then work the plunger. Maybe some
vaseline. Seems I recall there is a little rubber cup that causes the
key to pop up after you press it. May just need to clean around
and under the key.

(The 850 interface serial ports.)
The FAQ describes all four 850 serial ports, I think.
None but the com1 is of any use, basically, again, I think.

I should think so. After all they are just ROM routines which are always present on the machine (well to all intents and purposes). There are probably some quite handy bits in there as well (ASIC unlock code, music routines, a few quite nice sprite images etc)

Depends what you mean by 'the same level of access' The CPC+'s cartridges
are just ROMs in exactly the same way as the standard system firmware.
They don't, by themselves, have any special features (regardless of what
Amstrad wanted everyone to believe)

The difference is that the Burnin' Rubber game cartridge has to be present
for using BASIC (since it contains the BASIC interpreter and the firmware
ROMs) so all those handy game routines are always present. The same isn't
true of the C64 or Spectrum cartridges (I can't say I know much about the
Atari)

The organiser suggested to me in email that headers which count as
`metadata' (filenames, etc.) would not be counted as part of the
file's size. For example, it sounds like my entry "ztrack 1k" (for the
speccy) is probably going to be considered 992 bytes long for the
purposes of the competition, even though the .tap file is actually
1015 bytes.

Anyway, when is everyone else going to enter the competition? Most of
the entries were by me last time I checked... :-(

I was going to enter my Hit and Missile arcade game for the TI that I
wrote last year, until I saw they dropped the 2k competition. There is
no way to squeeze it down to 1k, esp. since on the TI _EVERY_ asm
instruction requires at least two bytes...
I tried a program file compressor, and it wound up saving 0 bytes...
I'm not willing to write my own...
Oh well!

Howdy folks

The old style cartridges (dark brown, with an aluminum insert/cover) could be opened by unscrewing it. But how do these XE style cartridges open? IIRC there are atleast two kinds of these new once, the ones with a sticker that goes over the top and the one where you can see the seem (?) between both cartridge case halves over their full length.

hi,
watch out if you pop the key for the little springs, you really have a spring problem, and there are 2 springs, one has gone a little haywire and has to much tension, that is why the key is stuck on.
try to compress the springs once you have them out, sometimes finger pressure is all thats needed, but sometimes i have to clip some sprring off, its usualy the inner spring.
be carefull to trim any spring that you clip because you do not want a jagged piece in there.
when you reassemble the key you will find that it is very hard because there are 2 springs, and the key has a plunger that must go thru both springs, so i flip the computer upside down, and reinstall the key that way.
good luck,
thanks,
lance

Well, I dropped the playback rate to 8000 Hz and turned off the
digitzed effects, and I think it's about as good as it's going to get.
The sound is consistent, though every two seconds or so it cuts for
about half a second. I may try the DOS version sometime, but I can
survive playing the games muted. Thanks for your help!

John

I'd guess you could ramp up the Hz to at least 22050, as long as you
are not running XP then I'd say give the DOS version a try. If you
are running XP then you *might* have problems such as no sound and no
Joystick.

Best of luck....Btw, try oh try to upgrade your PC, the spec is very
low compared to today's machines and it's very cheap to pick up a
fairly speedy Athlon etc.

If you try the computer shows then you will pay very little for a
vastly speedier machine.

Of course, it's very easy for me to spend your money :-)

MV> http://www.ffd2.com/minigame/

RF> A question: Amstrad tape headers are smaller than disc headers
RF> (IIRC). Will a game qualify if it's 1k on tape but larger on disc?

Well no one's forcing you to store it on disk, so I suppose so. But
not that when I'm talking about headers in the rules, I'm talking
about headers on real tape or disk media, not headers for emulator
file formats. Eg, on the spectrum, I wrote a small perl program to
analyze the taps Russell sent me:

ztrack1k.tap, 1015 bytes

Block 1 is 19 bytes of program header
Flag: 0x00 (header)
Type: 0x00 (program)
Name: "ztrack 1k "
Data length: 990
Parameter 1: autostart line 1
Parameter 2: variables start after 990 bytes
Checksum: 0x4e (OK)

Block 2 is 992 bytes of program data
Flag: 0xff (data)
Type: 0x00 (program)
Data: 990 bytes
Checksum: 0xcb (OK)

Now, being a Commodore guy myself I'm using C64 program files stored
on a Commodore disk drive as a sort of virtual ruler. If you compare
the Spectrum tap structure to a C64 PRG, block 1 corresponds to the 32
byte directory entry (containing file name, file type, and start
sector), and block 2 corresponds to the actual file data. As I see it,
ztrack1k is either 990 or 992 bytes, with the 19 bytes in block 1
simply being meta data such as the filename.

It's impossible to write rules that handle all the different formats
for all the different platforms out there. The rules will be applied
as best they can. And hypothetical discussions are fairly pointless --
the rules will stay fuzzy until there's an actual entry that forces me
to make a decision.

As Linus says, show me the code.

Hello Mathy,
there are two XE/XEGS cart versions: 1) made in Hong kong - this one has
longer pins and a screw right under the label, thus destroy the label to
open the cart; 2) made in Taiwan - this one does not have any screw,
just four plastic noses, which will (mostly) break if you open the cart;
unfortunately breaking the noses is the only way to open the cart (guess
why atari did it); you can however use some glue or plastic glue to
close the cart again... -Andreas.

Well,
I re-read the docs again and the docs to Colorsquash say something like
that: "it compresses in a Koala-style form...". Ok, so you are right (of
course), it is not koala, just a koala-style form - RLE. why didn`t you
write RLE then ?!? -Andreas.

Andreas Magenheimer schrieb:

Strictly speaking, your modem IS the data communications equipment and
likewise your computer/terminal IS the DTE....

>....Communication software often liked to report the DTE speed
>of data transfer as it could be faster than the actual DCE because
>of compression and decompression performed by the modems....

Quite, my 56K modem often approaches transfer rates of 100Kbps when
transferring text files.

Hi Mo,

> There was the other question though, on the 850 interface. Isn't
>one of the serial ports different in some way from the others?

Ummm, been a LONG time since I had an 850 so memory is hazy....

ISTR though that one of the serial ports (port 4) supports 20mA loop
operation?

Probably have an 850 manual kicking around....somewhere....

TTFN - Pete.

No kidding...I know I'm not using a top of the line PC by any stretch
of the imagination, but I can't see how this thing can't run an Atari
emulator. I have a NES emulator and it runs just fine. Can you explain
that to me? Oh, and I would love to get my 1200XL out of the basement,
but I just don't have the space and it would require a *lot* of
dusting :)

Does anyone know where i can get SCRAM? It was written by Chris Crawford, in the 1980's, I think.

Sorry, I don't know. But IIRC even the manual was copy protected
(copiers didn't like red paper). A friend of mine had the game, but that
was over 16 years ago, and I hadn't an upgraded 1050 at that time, so I
could only lend it a few times for playing (fixing broken pumps and
other damages after earthquakes etc.). You would need a cracked version
or at least an APE Pro image file (and a real Atari, because the
emulators don't support this format with its copy protection
information).

I would say, LOWER your hardware specs. I know a system which runs at 100% speed, never needs to be updated, starts-up much
quicker, has no skips in the sound and the processor is running even below 2MHz!

Unfortunately, when I wrote it, I wrote it as tight as possible. It
wasn't for a minigame compo, either, it was a program I had started
about 15 years before as a first game in assembly and never got past
the graphics (I was trying to write an assembly program like I did in
Basic... top down, from the hip, 'what's next', all in-line, ugh!).
When I started on it again, I threw away all the code, just keeping
the graphics... I think it is about 1800 bytes...

At least when I try the wolfpup site, most, if not all, the links on the page are broken.

Then I tried the geocities site http://www.geocities.com/atarimods/. It looks like just about everything is there... (of course I hate geocities because of the add banners that pop up). Unfortunately the SmartIDE link takes me to Supervideo.

I'm actually looking for the SmartIDE plans which I read through once about a year ago. I still haven't decided whether to go for SmartIDE or MyIDE... but at this point I'm leaning a little more to MyIDE since it looks so simple to build. I remember the SmartIDE instructions that Bob wrote had a lot of good practical tips about soldering up a rip-off board, mounting a drive internally, power requirements, etc. that would be a good reference for either mod.

How much activity is there in the TI family? Although you'd break the
size rule, maybe you can enter "out of competition" to show an entry
for a different machine than the more frequent (?) ones.

there's quite a large group of us on Yahoo, but the real killer for
the TI is a lack of programmers... mostly what is left are those
die-hards that had the machine from day one (like myself) and want to
push it farther, or newbies just discovering (or rediscovering) them
and wanting to know what is available - mostly stuff 10+ years old...

Well, I took out the shooting aspect of mine to make it a run/jump/dodge
game. I've got 9 animation frames of about 40x40 pixels each at 8 colors,
heirarchically connected graphical pieces, horizontal screen scrolling, and
takes about 100 raster lines to render, all in <512 bytes so far.
Anything's possible with a bit of elbow grease. :)

3469. 800 XL In MSNBC Video

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-13 06:41:45 UTC
From: Richard Anderson <richard_anderson@pacbell.net>
Message-ID: <JYPX8.199$n27.10811531@newssvr13.news.prodigy.com>
Source record: 28791

When I just popped into my ISP's homepage, I was surprised to find a picture of what
appeared to be an 800XL, so I had to check it out. It was a link to a MSNBC story
on the hacking of the USAToday website. About half-way through the video, there is
a scene of someone typing on an 800XL. It's quite interesting that they picked that
scene to clip for their link graphic. The link to the video follows:

http://www.msnbc.com/m/c/ctv_prodigy.asp?id=c_huckman_hackers_020712'

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

But the "19 bytes in block 1" *are* stored on tape. I thought you'd
realised that and were excluding them because it was metadata. Or is
that still right and I'm just getting confused here?

I think in retrospect it's just as well I kept the entire .tap within
the 1k limit. :-)

> that to me?

Atari was pretty straightforwarded at it's time. It's not just a matter of emulating the 6502 CPU and adding the o.s. core, but
one has to emulate all the other hardware inside the thing also. The ANTIC is also a processor which co-operates with the 6502c.
The 8-bits are more or less a kind of early RISC systems.

> Oh, and I would love to get my 1200XL out of the basement,
> but I just don't have the space and it would require a *lot* of
> dusting :)

If you have space for a PC keyboard, you also have the space for the 1200XL. The 1200XL is big enough to put a PC keyboard on top
of it. If you build/buy/borrow/steal a SIO-2-PC interface you don't need any peripheral other than the powersupply and a joystick
(and even that is not required when tapping power from your PC system). You can use your ordinary TV as a monitor, or if it is
located too far away, you can order a device (like the JAM or similar) to turn the video-output of the 1200XL into a VGA signal and
use your PC-monitor as Atari display.

The rules state that the game has to be able to run using the BASIC
RUN command or equivalent.

If |CPM can be considered an equivalent, the easiest way to do it is
to use a System disc, put the program on the boot sector, and include
a call to load the one extra sector to get boost it up to 1K. Should
amount to about 10 extra bytes:

```
ld hl,#300
ld d,1
ld e,1
ld c,#42
call #be89 ;(Check this address, it may not be correct).
```

Source record: 28698

I just revitalized my old Atari setup.

It uses the MIO board, and enhanced 1050s. I still have lots of personal files on the HD and floppies.

What is the best way to transfer the files to emulator Atari800Win emulator images. They would be much easier to use in the long haul.

That old 50MB hard disk is huge!

Has anybody managed to get BASIC XE, Mac/65, and Action carts on the emulator?

There was a product called "JAM!" which would take video (RCA-jack style,
or S-Video) and convert it to VGA.

You'd then plug your [Atari / video games / VCR / DVD player / whatever]
and your PC into it, and then plug it into your monitor.

Push a switch to toggle between the two.

I have one, but haven't used it in a while. (May still need it, though,
so I'm not giving it up quite yet :^))

Unfortunately, I think the folks who made it are gone.
I'm sure there's something similar somewhere, though.

Good luck!

My absolutely out-of-date "New User / Emulator Help" FAQ might be useful.
It goes over a lot of general Atari facts, how to get around BASIC and DOS,
and of course talks about using the various emulators (THIS is the part
that is so sorely out of date :^( )

http://www.sonic.net/~nbs/new_and_emu.html

Enjoy!

3486. New CD-ROM of Atari PPP/DGS products

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-13 21:23:09 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1026595663.27968.0@iris.uk.clara.net>
Source record: 28707

Hello All,

Further to my posting of a few weeks ago, I've now decided to release a PC CD-ROM containing all the Power Per Post products, along with some of my own. The licenses problem of a few weeks ago has been resolved. It appears the licenses for the Power Per Post products transferred from PPP were the German versions, not the International English versions. Therefore, I am still allowed to continue selling the English versions of the PPP products.

The CD will contain the following:

Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
Quick Support Disks 1 and 2
SAM (Screen Aided Management) (latest version)
SAM Budget
SAM Designer
SAM Utility Extensions
4 Power Per Post games: Rubber Ball, Glaggs It!, Bombi, Mine Sweeper
QuickEd (Character set editor for mouse, joystick and touch tablet)
Digi-Studio
Issues 1-14 of our News-Disk on-disk magazine
Issues 15-19 of the printed magazine carrying on from the on-disk mag (scans of the original mags)
Issues 20-26 of the on-disk magazine carrying on from the printed mags
News-Disk Yearly Disk 1 (disk to go with the printed mags, includes lots of Quick source code)

Each product will be on the CD as a DCM file for transferring to Atari disks, and ATR format for running in Atari PC emulators. Manuals will be in PDF format, and will either be new versions of the manuals, or scans of the originals.

Full details of all these products can be found on the DGS website (http://www.dgs.clara.net) in the commercial software price list. Please ignore the individual prices shown in the price list.

The cost of this CD is still to be decided, but will cost no more than US$15 including shipping. This is a massive saving on the original cost of these products. You will be able to pay with a credit card, because the CD will be bought through amazon.co.uk (http://www.amazon.co.uk) zShops.

I'm in the process of getting the software on to the PC at present. Then I'll be scanning and converting the manuals over. The CD should be ready in about 7-10 days time.

What I need now are purchasing pledges. If you are likely to want to buy the CD, please e-mail me at: dgs@clara.net

Here's what's up:

ANCIENT COMPUTERS NEEDED FOR H2K2
Posted 17 Jun 2002 09:41:47 UTC
The call is out for old, ancient, and obsolete computers to bring to the
H2K2 conference July 12-14 in New York.

At H2K2 there will be an entire "neighborhood" in the 35,000 square foot
network space dedicated to antique computers and retrocomputing.
Attendees are encouraged to bring their Ataris, Commodores, Tandys,
Colecos, Altairs, and any other 70's or 80's computer. This will serve
as a museum, bazaar, and recreational area with several contests running
throughout the conference. We especially encourage bringing hacked and
expanded machines. All we ask is that you bring machines that actually
turn on and do something.

H2K2 will also have current day systems set up throughout the networking
room as well as a massive wireless network that will encompass the
entire area.

If you are interested in volunteering or plan to bring large amounts of
gear email retro@2600.com.

Hi Atari-users.

I have had many many emails about building the interface, but I don't have the time. I think now is the time to have it build. If you want one, go to my homepage (www.atari.myweb.nl) and signup at the "I want a MyIDE" page. If I have 20 buyers, I can start the production of this interface.

Kind regards,
Mr.Atari

3498. For Sale : ATARI XE carts

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-14 21:24:29 UTC
From: lord-chaos@t-online.de
Message-ID: <8209624b.0207141324.59dc9983@posting.google.com>
Source record: 28719

Hi,

I still have lots of new,factory-sealed ATARI XE carts :

These games are not-used !

I have :

Ace of Aces
Archon
Airball
Ballblazer
Battlezone
Crimebuster
Crossbow
Davidï¿½s Midnight Magic
Desert Falcon
Eastern Front 1941 (silver)
Final Legacy
Gato
Hardball
Joust
Loderunner
Millipede (small box)
Millipede (big box)
Moon Patrol
One on One
Pole Position
Rescue on Fractalus
RealSports Football
Star Raiders 2
Tennis (small box)
Tennis (big box)
Thunderfox

+ Microsoft BASIC on Disk and Mickey in the Great Outdoors /Disk

+ Scram/Tape.

All these games are NEW,not used and I sell them for 6 - 15 Euro
depending on the title (1 Euro ca $1).

Some of the (XE) games work only with ATARI XL/XE machines,not ATARI
400/800 , because they req. 64K+ , the old games like Moon Patrol
should work on all systems.

The boxes are in perfect condition,not damaged , but I also have some games with damaged boxes which I can sell for less.

Iï¿½m in Germany and can ship worldwide.

If youï¿½re interested,please contact me.

Donï¿½t pay too much for used games if you can still get NEW ones !!!

Thimo Graef

Hello guys,

me have been offered a stock of Atari-items. However, I am not sure if I should take it, as the Atari-sales have not been that good the last time. This would be the prices, if I buy it and offer it in our shop:

Cartridges
Thunderfox 17 Euro
Into the Eagles Nest 32 Euro
Joust 17 Euro
Tennis 32 Euro

XEP80 (80 letters card for XL/XE 47,00 Euro
Atari Deluxe Joystick 25 Euro

All items are absolutely new and unused. I have no sure idea, but I think this is too expensive. What do you think, guys?

Regards

Thomas

Sorry but the prices are really to expensive for most cartridges you can ask
max. 5 Euro and the XEP80 maybe 10 euro... Joysticks, may 5 euro also... A
few years back we got these items almost for free... most active Atari users
in Europe have these Items. But you can sell them on ebay maybe....

3503. OT: Palm Pilot Help

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-15 01:32:06 UTC
From: hajjej@aol.com
Message-ID: <844961af.0207141732.5a0e5757@posting.google.com>
Source record: 28724

Hi all, I normally don't like to go off topic on this board, but I am really frustrated here. When I try to perform the first hot sync I keep getting the following error message when trying to add my name as a user. Add User Error Could not add user "John" "John' is an illegal user name, or the user directory could not be created. The Palm seems to be connecting to my PC ok. Any help would be GREATLY appreciated.

John

3504. SpartaDOS Format Virtual drive >1MB

Newsgroup: comp.sys.atari.8bit

Using Atari800WinPLus v 3 and various versions of SpartaDOS.

I can format an ATR volume up to 1MB fine, but cannot go beyond it. HDINIT responds with ??Shows Multiple Tracks??

MyDOS does fine, but I prefer SpartaDOS.

Has anybody found a work around?

Howdy Andreas, Lance

> there are two XE/XEGS cart versions:
> 1) made in Hong kong - this one has longer pins and a screw right
> under the label, thus destroy the label to open the cart;

I don't like that.

> 2) made in Taiwan - this one does not have any screw,
> just four plastic noses, which will (mostly) break if you open the cart;

Don't like that either

> unfortunately breaking the noses is the only way to open the cart (guess
> why atari did it); you can however use some glue or plastic glue to
> close the cart again... -Andreas.

Glue is kinda permanent. I don't like this either. If I had my own plastic factory.....

CU Mathy van Nisselroy

PS do both carts have/need printed circuit boards with the famous hole in the middle, like the old style cartridges have/need?

> Thunderfox 17 Euro
> Into the Eagles Nest 32 Euro
> Joust 17 Euro
> Tennis 32 Euro
>
> XEP80 (80 letters card for XL/XE 47,00 Euro
> Atari Deluxe Joystick 25 Euro
>
> All items are absolutely new and unused. I have no sure idea, but I think
> this is too expensive. What do you think, guys?

I just checked the ABBUC site at http://www.abbuc.de

Thunderfox 1.30 Euro
Into the Eagles Nest 1.30
Joust 1.30 Euro
Tennis 1.30 Euro
XEP80 5.15 Euro (incl. Postage and Packaging in Germany - 8.70 Euro,
Europe - 15.50 Euro, rest of the world 18.00 Euro)

I couldn't find any joysticks on their site, but it I guess you get the
point.

CU Mathy van Nisselroy

PS to those of us who don't know what the Euro is, it the common currency we
use in Europe since halve year. It's worth is just above or below the US
dollar.

3512. Very nice USS Enterprise (Star Trek) drawing.

Yes, I realize that it's stored on a real tape, and yes I consider it
metadata, just like a directory entry. The filename isn't part of the
program, imho.

Precisely the kind of solution I'd like to see. As long as you only
use two 512 byte blocks on that disk image, it's a perfectly valid 1K
entry.

3515. SpartaDOS

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-15 13:39:55 UTC
From: Wef Dinaini <not@here.com>
Message-ID: <3d32d0a8$0$230$4d4ebb8e@news.nl.uu.net>
Source record: 28736

Hi All,

on the off chance that this post initiates a new cascade, I have the
following questions:

1. Can someone mail me a fully functional SpartaDOS ?
2. If not, point me in the direction of one ?

I seem to remember that SpartaDOS's copyright is still being
actively puruited, and that it's still for sale. If this is the
case, I'd be happy with a link.

Kind regards,
Wef

> > I have and use the Cheese Video Box:
> >
> > http://www.avtoolbox.com/vd-300.htm

The output picture quality is not "perfect," but it's very good. I've
got a 130XE connected to it via the s-video input rather than the
composite video input and, never having experienced the Atari's separate
chroma/luma video output before, I was fairly stunned by the clarity of
the picture. Best I'd ever seen, despite the "noise" introduced by the
Cheese Box.

Even if you use composite in rather than s-video in, it's plenty good,
probably better than a good TV.

I've also got my XEP80 attached to the composite in on the Cheese Box.
This is also nearly perfect, except that I couldn't quite get the entire
80x24 signal onto the screen. But it was good enough that I put away my
monochrome 80-column monitor.

I have a PC, my XE, and the XEP80 all sharing the same PC monitor,
rather nice!

I found the video here:

Huckman Hackers
http://www.msnbc.com/news/779372.asp
thanks to a Google search.....

And then used ASFRecorder to grab the 1.2 meg file as an asf file.
ASFRecorder is available at:
http://www.zdnet.com/downloads/
You'll have to search for it from there.

Use this URL for ASFRecorder to latch on to it:
mms://od-msnbc.msnbc.com/msnbc/video/modem/c_huckman_hackers_020712.asf

watch for word wrap!
PS - I used my TIF folder to find the correct asf URL - you may need to use
another one or as they say, your mileage may differ

Check out this web site <www.atariprotos.com/personal/john/roms.html>
you can download the rom images for the OSS cartridges and run them on
the 800Winplus emulator version 3.0. Use the option for an OSS M091 16
bit cartridge.

Regards,
kvan

My Workaround:
I format the 16 meg ATR using my real 8-bit and APE. Then I copy that ATR
and use it whereever I need it. I can ZIP up the Blank.ATR file and send it
to you if you like (being blank it zips to a tiny file).

First of all, I don't know anythign about SIO2PC, APE or Atari Emulators.
I don't understand what you want exactly. The first sentence above seems to
be the opposite of the second. I know nothing about turning real files into
ATR's or XFD. Except that on the Atari 8 bit, DISKFORMER (check my stuff
page) is a nice utility. It turns ATR's and IIRC XFD's into real
files/disks. It can turn disks into something IIRC, but I'm not sure if
that is XFD, ATR or both. On the PC side... sorry, can't help you.

CU Mathy van Nisselroy

PS find a nice two player game and invite your wife to join. IIRC Analog
Computing once had a very nice two player PacMan clone called TwoMaze. It
is better then PacMan (more mazes).

Hi all,

just a few quick questions:

1. is there anybody over here who is willing to make a few cartridges
(PCB only should suffice) for me from ROM images I downloaded from
http://www.atariprotos.com/personal/john/roms.html ?
Materials and the use of your time will be compensated, of course.

2. Does anyone know if Frank Ostrowski's Turbo Basic is available
on cart ? Has it been done before ?

Regards,
Wef

Hi,

I seem to know the answer to this one: last week my SIO2PC cable arrived,
and
I've been messing about with my old hardware. Oh, the joy ;)

I downloaded the SIO2PC software, and one of it's options is FILE2PC, which
seems to be just what you're looking for; it's described fully in the docs.

Note: The docs say it's impossible to run SIO2PC reliaily under Win. They're
partly right. Reading from virtual disks, and even the Mega-ATR's works like
a charm, but even my PIII-450 won't write under Win. It seems to work okay
under DOS, though.

Regards,
Wef

> joystick.

A friend of mine had one; it was good, the BASIC was comprehensive, and
it had a nice keyboard. The joystick seemed a bit flimsy to me (you could
use it to scroll about the screen - like a window.) It had a ROM socket
on the side, and you could *program* the layout of the screen. In fact,
one mode could be made to look like the Speccy, and a few games were
converted in this way. (I think there was one called StarStrike)

The envision.atr file is a boot disk, which runs Envision.
envision_tools.atr contains the additional tools that originally came with
Envision, as well as several sample files. You don't need envision.atr to
see the enterprise picture. If you boot using the envision_tools.atr image,
you will get a DOS 2.5 prompt. Just run MAPDSPLY.COM (on an XE or an
emulator in XE mode), and type "NCC1701" (without the quotes) when it asks
for a filename. Then press RETURN. You can scroll around the picture with
the joystick.

Hope this helps.

KEN,
I know the owners of Spartados 3.3c and Spartados X.
Matter of fact I am personal friends with one of them.
He has all ready seen the posting and knows about it.
I would think long and hard about what you do at this
point. Or you might have a lawsuit on your hands. I
believe that Freeware and PD are OK to distribute or a
program that is NO longer being developed for many
years but to resort to giving away free copies of a
program that only costs 15 or 20 dollars is just plain
stupid!!!!!!!

Thanks,
Carey Christenson

Hi Wef,

Spartados, and all of ICD's 8bit product line (as well as Wes Newells) items were bought out bye Fine tooned engineering in the early 90's. Althought they had been selling a few items and developing their own lines Fine tooned soon went bust. The company owner dissapeared leaving a trail of unhappy customers with unfilled orders (myself included) and even more unhappy suppliers who to this day are probably still unpaid.

Thanks it works now. Very nice!

It turns out, xformer was giving me problems because it doesn't read long filenames well...so it was loading xformer.atr disk image instead of xformer_tools.atr. Plus the extra instructions on mapdsply.com helped as well.

3544. How to replace an XL power supply with an IBM PC power supply

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-17 04:43:02 UTC
From: madhobbit@geocities.com
Message-ID: <e56627ef.0207162043.3d6bae00@posting.google.com>
Source record: 28667

After having my old beloved 600XL sit collecting dust in a closet for over five years, I decided today it was time to do something about the dead power supply. I looked around on eBay and other places to investigate buying a replacement, but I didn't really want to spend a lot of money, and I had visions of the new one fizzing out just as my first two did. So, I went about building a replacement. It works great, it cost me zero dollars, and I'm sure someone besides me is interested in knowing how, so I'm posting a description of what I did.

WARNING: There's no reason to believe that I know what I'm doing. This worked for me. It kept my machine running for two or three hours, and I have no reason to believe it will fail any time soon, but for all I know it's slowly killing my computer. There are high voltages involved at some points, so if you're not careful you could probably kill yourself.

The power supply in question was one of the big brick ones for my 600XL; my 130XE uses the same one. I believe that a number of Atari's 8-bit machines use it. It has a round 7-pin connector to plug into the computer.

To build my replacement, I used:

- The connector cable, cut off the broken power supply.
- An AT power supply from an old 486
- Two short lengths (2") of reasonably heavy-duty wire (because of high voltages)

You'll also need a PC power cable to plug the power supply into the wall. Wire cutters and strippers are also nice, though a sharp knife will do the trick. A voltmeter/multimeter is good to have so you can check your work. A soldering gun is -not- required.

The theory: The Atari power supply is supposed to supply 5 volts DC to the computer. When mine broke, it started supplying 9-11 volts, and the computer stopped working (just a low buzz from the TV and garbled video). PC power supplies also provide 5 volts on some lines, with more than enough power, so they can be used as replacement parts, and they're easy to get.

An AT power supply is essential - not an ATX. There are a few ways to tell the difference. The most notable is that the AT supply has two identical plugs to connect to the PC motherboard, with six wires in each (different colours though). The ATX supply has one big block connector. The reason I used an AT supply is because ATX supplies have a soft power switch on them, meaning that circuitry inside the supply

decides if it is on or off, and some lines always supply power. An AT supply is either on, or off. AT supplies were used in machines from the original IBM PC up to Pentium-class systems. Everything from Celeron and Pentium II machines and newer uses an ATX supply.

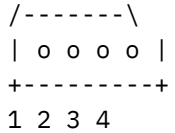
If nothing is connected to the power supply and you plug it into the wall, nothing will visibly happen (careful, some wires go live instantly). This is because the power supply expects a power switch in the computer case to turn it on. A block of five wires comes off the supply: black, brown, blue, green, and white (these are fairly standard colours). The green wire often has a yellow stripe on it - this is the ground wire. The other four normally plug into the power switch. Since I didn't have a spare switch lying around (they're only a buck or two at a computer parts store) I hard-wired the power supply to be on, as follows:

The brown and blue wires are -always- on. If the power supply is plugged in, these wires have 110v on them. Be very careful :-) The white and black wires are used to carry the power from these wires back to the power supply when the switch is on. So, to turn the power supply on, the brown and white wires need to be connected together, and the black and blue wires need to be connected together. The green wire is normally grounded to the PC case, but it's not critical if it's left floating. I used two short lengths of heavy copper wire to make the connections, and I simply jammed the ends of the wire into each plug. Don't let the green wire touch any of the other four, and don't let the two pairs touch.

After these connections are made, plug the power supply in. The fan should go on immediately. If it doesn't, then either the supply is broken, or it isn't wired correctly to be turned on. Unplug it immediately, and check everything carefully. If the fan's not on, the power supply isn't working, and there's no point going farther.

Now that the power supply is working, we can get power out of it. Among the cables snaking out of the back, there should be two six-wire blocks for the motherboard, some four-pin connectors of about the same size, and some smaller four-pin connectors. There's normally some other random wires hanging around, which don't concern us.

The large and small four-pin connectors are normally used to hook up the hard drives and floppy drives, respectively. They have identical pinouts, and supply both 5 and 12 volts DC. Taking one of the large connectors (because it's easier to work with), look at it end-on. One of the long sides will have the corners angled, like this:



The two center pins (#2, #3) are both ground. The one on the left in my diagram (#1) is +12 VDC, and the one on the right (#4) is +5 VDC. Here it's a good idea to use a voltmeter to measure the voltage across pins 3 and 4 (or 2 and 4) and make sure it's 5 volts. This is the power source for the Atari, so it's important to get it right. On my power supply, the 5 volt wire is red, and the 12 volt is yellow.

Now, cut the wire off of the dead Atari power supply (the wire that connects the brick to the computer). Cut it quite close to the brick, so that you have a nice long length of cable to use.

The 7-pin connector is wired rather oddly. Looking at it end-on, with the notch on the bottom, the three pins on the left are all ground, and the three pins on the right are all +5 VDC. The middle pin isn't used at all, and the round outer shell also isn't used. So despite the fact that there's seven pins in the connector, there's only two wires on the connector cable, making it a lot easier to wire.

The cable coming off my connector is a nice two-wire cable that can be split down the middle to peel the wires apart. Both wires have black insulation, but one has a white stripe on it. The striped wire is the +5 VDC wire, and the solid black one is ground. I simply stripped about a half-inch off the end of each wire, folded the exposed ends in half, and jammed them into the 4-pin connector from the power supply. The striped wire is in the pin labeled #2 in my above diagram, and the solid wire is in #4.

Theoretically, that's it. Now it's a really good idea to turn on the power supply (making sure none of the wires you've connected are touching anything else) and test the voltage on the output pins. If it's +5 VDC, you're good to go...plug it in to your Atari, and everything should work perfectly. If it doesn't, either something's broken worse, or you've proven that I'm not as good at electronics as I think I am. I have two machines with fizzed power supplies, and with this new one my 600XL works great, but my 130XE just gives a solid black screen. I suspect it's broken on a more fundamental level.

Now, this is clearly a bit of a hack job. I plan to clean up the wiring in a couple ways:

- I want to get an AT power switch and use it instead of the hard-wired power leads. This would let me turn it on and off instead of unplugging it every time, and I feel a bit more comfortable about where 110v is going :)

- I need a better connection to the 4-pin power plug. Sockets for the plug are widely available, since they're used to hook up fans and the like; I want to clip the wires coming off the socket and use heat-shrink tubing to make a proper attachement. This way, I have a secure attachement, but I haven't actually damaged my AT power supply, so I could put it to other uses in the future.

Anyway, there you have it - my cheap solution to my broken computer. (Power without the price!) I hope someone finds this useful; I'd love

to hear if this works for anyone else. It's certainly made my day :)
Again, if it doesn't work, I'm terribly sorry, but electronics isn't
my forte. I'm not a regular reader of the 8bit group; I'm posting this
because if anyone else cares about this, it'll be the people here :-)

Darryl

P.S.: If you try this, -please- make sure you understand what you're
doing. It's late at night, and I may have made a typo. If something
doesn't make sense, be very careful. Your voltmeter is your friend;
check the voltages. I'd really hate it if someone toasted their
machine because they were following my instructions.

3545. Posting long urls

Newsgroup: comp.sys.atari.8bit

Slightly off-topic for the group and discussion but, I've found many people
using horrendously long links. If anyone is interested, this might be a
much better way to tame the beast (and stop the url from being b0rken!)

http://tinyurl.com

That'll shorten things for everyone and make life easier.
If you goto that link directly from the page you are viewing (with the super
long url), it will automagically transform it to something smaller.
It's been a great timesaver for me so hopefully it's usefull around here :)

- Shangrila

Hi,

what I see in this thread now is dire warnings not to copy full versions for
others, but
on the other hand I have someone here teling me that the owner of the
copyright has
disappeared. Hmm, catch-22 ain't it ? I could (and already do) go for the
shareware
version.

Or am I missing something here ?

Regards,
Wef

Man, that brings back a flashback. I made a printout on my XMM801 printer back then and had it on my wall. Was a real piece of work.

You still have to copy the whole URL to that page to get the tiny version. It's just as
easy to copy it to the location line open it
then bookmark it.

> on cart ? Has it been done before ?

Available, I don't know, but it has been done before more than once. In the early 90's there was a "how-to-build" article in a
Dutch ATARI magazine, but I don't think I'm able to relocate the issue since my place is a big mess...

More recently I saw a German upgrade in action (JHV 2000 iirc). It was a modified o.s. ROM which started up with a menu to select
between ATARI BASIC and TURBO-BASIC. Don't know the exact details, so this info is of not much use unless someone over here knows
more about it.

I have the original Sparta-Dos 3.3c cartridge. This version is exactly the same as the 3.3b version. Only difference is that "b"
is on disk, while "c" is on cartridge...

Thanx anyways.

If you like the shareware/freeware version just stick with it. It is still considered impolite around here to violate a copyright when the holder still wants to exercise their rights. The freeware version is really as good as any of the others. IIRC the profit on the freeware version came from selling the manual for ~$10 if you decided to register it. It wasn't like it was SD 1.1 or something that was distributed, it was the latest/greatest disk based <vs. cartridge> version with some bug fixes. The disk based version of MAC/65 was distributed on the same disk.

STEVE CARDEN!
(Worked my brain to come up with that name.)
We've had discussions of Sparta/FTeDOS before, who did what to
make which version. Somebody worked with Mike Holman (FTe
owner) and did 3.2F and 3.2G. Those are shareware and
I don't think any argument about passing around, even tho
FTe wanted a $20 registration, which you can't pay if you want to.
I'd like to see an accurate account of the people and companies
who made above 3.2D. Up to 3.2D, it was ICD, before FTe bought
the rights. 3.2G seems to be the one of choice for real ataris.
3.3A was done by somebody (maybe Tom Hunt). and is the only
one that works with emulators, methinks. 3.3B seems to be like
3.3C somebody said. 3.3C can be obtained on disk or cart, but
is carefully guarded from passing around by Mr. Ringquist of
Video 61, which he sells, the 3.3C version. Mr. Ringquist, Bob
Klass and, I think, Mike Holman had some dealings and possibly
payment to the rights to SpX and 3.3C.
A bit confusing, but I do remember the name Steve Carden as
someone who worked on SpDOS, and that name seems to have
gotten lost in the discussion of who did what.

About SpartaDOS 3.3, are you planning in the future to release the source of SpartaDOS 3.3 as 'Open Source' or are you planning to keep it fully to yourself? I think the sources are only interessting by active SpartaDOS users that mostly use 3.3B. SpartaDOS X is already dead, when you have sources maybe you can consider to release them in the near future to allow the few active programmers that are still around to update/upgrade this DOS.

I really don't think you will sell less cartridges when you release the source...

Look at version like DOS 2.x and MyDOS these sources are freely available, also I have a Polish disassembled and documented SpartaDOS X...

3559. St. Louis Trip

Source record: 28687

FamilyNet Newsgate

As some my know, my wife and I went to St. Louis this weekend. To visit family, but also to attend a Atari Jaguar (and general video gaming) festival and to see the Amtgard group over there, the Duchy of the Western Gate.

There is a report of what happened at the JagFest that can be found at... (I show up on day two... they give a cool mention about me.) ;)

http://www.ataritimes.com/jaguar/features/fea_jagfest2k2.html

My pictures that I took of the JagFest and the Amtgard group there..

http://www.geocities.com/doctor_clu/StLouis/

(Forgive me if Geocities gives that "Too much traffic" crud)

And then there is the review I gave below...

@>-->----------

Just wanted to say that I just got back helping JT from unloading his equipment (thanks to him, we managed to have a good 20+ monitors for the JagFest... not to mention the video gaming musuem he brought up).

I would have to say that the JagFest was indeed a central meeting ground, and met the needs of those in Texas, Florida, Japan... as well St. Louis and other places there at the fest. I know there was at least a strong showing of those of us in Texas. (Currently writing this from relatives I'm visiting in St. Louis.) It was great to meet James and see what work he has done on Native so far, and had fun playing him at various Jaguar games, getting his introduction to Super Burnout and Fight for Life (my first time to pick up and see those games... both have their moments and can be enjoyable.) Great to beat James at pong. :)

There were some guys there from Japan that were extro-oridinary. We figured they saved up money for a while and blew it on this event. They donated a N591 Nuon DVD player complete with the rare Korean Nuon game and made it a prize in one of the tournaments. That was incredible. It was also fun beating them at pong. ;) They also featured in the museum exhibit upstairs (and later gave away) a Korean NES clone that looked like they modified the Atari Jaguar casing and molded it in yellow plastic! (Called a Zenon II). I would love to get ahold of one of those, kick out the NES motherboard and put in a Jaguar motherboard!

Great meeting up with Dan and seeing some of his work with the Atari Times Newsletter. And just hanging in general. Great meeting up with Greg George. He was very helpful in getting me settled in and helping me in setting up a networked Battlesphere game and in demoing the JUGS setup and the Battlesphere Gold CD bypass system.
It was great meeting up with Tim Wilson (and beating him at pong). (grin)

It should be noted, yes I won the pong tournament. Man that was fun. Tim won the Defender (on the Atari 8-bit computer) with a score like 200,000! (James came in second place with 149,000, and the third place was Jim at 121,000). For a short while my score of 34,000 did well, but that was before all of them played. ;) The Brutal Sports tournament was a smashing success, and what was great about it was that most of the people that signed up had little or no prior experience with a Atari Jaguar. I overheard one teenager saying "Man this is cool... ok, now I want one of these just so I can get this game." They were doing great at the game. They were even making points. Usually I just ignore the ball and just kill off the other side. ;)

The Mayfair hotel was a beautiful place, made for a pleasant environment for all this to take place. We had two local game dealerships at the fest.. Slackers and Trade-N-Games. It is hilarious to mention that Trade-N-Games has a unique business card... a Atari 2600 cart with his business information on it. He gave me his "card". Definately hard to loose this business card.
At the fest Trade-N-Games let me demo the new Atari 2600 game "Mr. Roboto" which was game of Berzerk with Styx's Mr Roboto song playing throughout it. It was really cute. And while I was playing that song, I was bassing away on a rare stereo chair... a chair with a speaker system built into it. I found myself buying from both of those vendors before they left.

After the fest was over, we got to talking and we started to pack up. We kept hedging toward leaving, but eventually ordered a pizza to be delivered and unpacked our Jags and stayed around for some more gaming, tinkering with music demos, and just talking in general. Didn't get out of there till roughly two in the morning. And that was just for the portion I was able to attend on Saturday. Maybe someone can shed some light to what happened on Friday.

Thanks for a great JagFest everyone!

Greg Goodwin / Doctor Clu

actually I missed something. I forgot to mention that fine tooned did a disk based version of spartados as shareware (paying the fee got you the manual), it was called version 3.2g if I remember correctly. I'd hafta double check since I havent used spartados in years (I'm a regular mydos user)

That is a very impressive list of Atari 8 stuff at the link from the eBay page.

BTW, FWIW De Re Atari was *not* written by 'Anno Domini'; it was mostly by Chris Crawford and others in the Atari Corp Software Development Support Group. They included Lane Winner, Jim Cox, Amy Chen, Jim Dunion, Kathleen Pitta, Bob Fraser and Gus Makreas.

> http://tinyurl.com

You forgot to mention the negative effects. If the server from the url-redirector is down, your site cannot be reached using the
short url. As a matter of fact, the chance your site is not available doubles when using an url-redirector.

Secondly, virtually all show nasty things like a pop-up windows or a banner/headfer/footer or whatever. Others don't change the
url in the addressbar to your real one when accessing the site, so everytime one hits "refresh", your default.htm or index.htm will
be re-loaded...

If you have an Atari site, you may consider getting an easy url at http://atari.org. I have mine for just 2 days so it's too soon
for me to say something about reliability, but I hope it's o.k. And as a bonus, you always have "atari" in your url...

Negative effects come with just about anything. I've noticed the tinyurl redirect to be reliable and without any sort of spammy connections. It was merely a suggestion. You guys went off on a bit of a tangent for something meant to be a trivial comment. Also, it is moreso intended with news links since they are the main culprits for the woefully long urls. Using this service as a website redirect is probably not its intended use. As mentioned, you would use atari.org or perhaps dyndns for any sort of webhop redirect or to host your own website. Those particular solutions are outside the scope of my intended comment.

My usage of tinyurl has never shown me banners/headers/footers/popups etc etc etc...
If you don't trust it, don't use it... the intent of my comments were to provide a convenient solution for long urls since long links tend to end-up broken for many people viewing the newsgroups. In my opinion, it made things easier.

I did, however, make a slight error in the last post. There is a way to create a link on your IE toolbar or in your favorites. When you click on the link from your favorites, it will automatically take the last visited webpage and make it shorter.

Found here: http://tinyurl.com/#toolbar
Again, if you don't like or want to use it, don't! I'm very much against spam but I dislike broken links almost as much. I find this is a good tool. So use it or don't, upto you. For those of you that prefer shorter news links, this might be easier for you. There are other similar services out there and the anti-spam community hasn't had much of an opinion with these "redirects" so for now, I don't see any harm done.

Cheers!
- Shangrila

3577. DGS/PPP CD-ROM - progress update

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-19 17:50:48 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1027101371.16702.0@dyke.uk.clara.net>
Source record: 28598

Hello All,

Just wanted to bring you all up-to-date on the progress of my CD-ROM of Atari 8-bit software containing commercial software released by Power Per Post (International English Versions) and myself.

The CD is well on the way to completion. I only have some more magazines to scan and one manual to re-edit.

I still need purchasing pledges. So far, only a few people have expressed an interest. The CD will contain ATR and DCM versions of all the PPP software, along with my own Digi-Studio package and all 26 issues of my magazine published between 1991-1996. A full contents list is shown below.

The cost of this CD will be around US$15 including shipping. This is a massive saving on the original cost of these products. You will be able to pay with a credit card, because the CD will be bought through amazon.co.uk (http://www.amazon.co.uk) zShops.

Full details of all these products can be found on the DGS website (http://www.dgs.clara.net) in the commercial software price list. Please ignore the individual prices shown in the price list.

If you would be interested in buying a copy of this CD, then please e-mail me: dgs@clara.net

NOTE: this CD cannot be sold to anyone in Germany, Austria, or Switzerland. My PPP license does not cover these countries.

Dean Garraghty

The CD will contain the following:

* Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
* Quick Support Disks 1 and 2 (example code and tutorials)
* SAM (Screen Aided Management) 80-col desktop system (bit like GEM) (latest version)
* SAM Budget (spreadsheet)
* SAM Designer (DTP/desgin package)
* SAM Utility Extensions
* 4 Power Per Post games: Rubber Ball, Glaggs It!, Bombi, Mine Sweeper
* QuickEd (Character set editor for mouse, joystick and touch tablet)
* Digi-Studio
* Issues 1-14 of our News-Disk on-disk magazine
* Issues 15-19 of the printed magazine carrying on from the on-disk mag (scans of the original mags)

* Issues 20-26 of the on-disk magazine carrying on from the printed mags
* News-Disk Yearly Disk 1 (disk to go with the printed mags, includes lots of Quick source code)

3579. OSS Newsletters

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-20 05:46:58 UTC
From: llpwhite@cs.com
Message-ID: <20020720014658.15619.00000231@mb-ca.news.cs.com>
Source record: 28600

Way back when, I subscribed to the OSS Newsletters for several years. They were supposedly published quarterly, but in actuality, it was pretty sporadic. When OSS sold out to ICD, I had just re-subscribed, and ICD never published any more issues (story of my Atari life). I have printed copies from the Spring and Fall of 1984. Then I have disk issues from the Fall of 1986 and Winter of 1987. I am pretty sure that the Winter of 1987 was the last issue ever published. Is anyone aware of any other issues that were published?
Thanks,
Larry

3580. ReConvert a ATR to COM

Newsgroup: comp.sys.atari.8bit

Howdy *.*!

I think there is a tool availble, which is capable to "compile" a
standard executable .com or .obj File into a single ATR File.

How could I reconvert the ATR back to a single executable?

Hmm. I suppose it's worked out that way, probably because I hadn't
done much programming recently.

> should make the standings Sinclair 4, Commodore 2, Amstrad 1.

I just hope the competition doesn't end up as dominated by the C64 as
it was last year.

I never understood why people did that, convert
a .obj to an .atr. I guess it is to make the file
just boot when booted from.
I would guess that these are single stage loading
boot files. Then I further guess you could take
the load, init and run addresses out of the boot
record and put them in a load file. Most of these
are probably files that don't load from DOS, have
to have a menu loader.
The boot record goes like this:
byte 0, sector 1 (first 4 sectors are always 128 bytes,
or is it three) Not used, stored in dflags ($240)
byte 1, # of 128 byte sectors to load
byte 2, lo of load adr
byte 3, hi of load adr
byte 4, lo of init adr
byte 5, hi of init adr.
The boot sequence gets the # of sectors, then the
adr to load at, then loads the sectors then jsr to
init adr.
If it is single stage, then you just dump the # of
sectors in byte 1 (? starting at sector 4?), prepend
a FF LO HI (start adr) LO HI (end adr). and post
pend the RUN or INIT adr.
Maybe.

I'm afraid I didn't get it right.
The Atari doesn't jsr to the init adr in bytes 4,5.
It saves bytes 4 and 5 in the DOSINI, ($C,$D).
Then it jsr to load adr +6 (the first six bytes
of sector 1 get loaded at the load adr.)
Uh Oh.

3586. Orc Attack on Atari800Win...Please help

Hi,

There's a problem when playing Orc Attack on Atari800Win ousing ATR or EXE, the orcs don't connect the ladders correctly.
I came across a Polish forum, so I tried to translate the messages, it seems a Polishman had this same problem.

Check - http://atariarea.nostalgia.pl/forum/viewtopic.php?t=182

Anyway the answer is to load Orc Attack using DOS II, I've tried doing this but no sucess. Please could someone tell me how to load a disk through DOS.

Any help appreciated.

Regards,

Michael

Over the years, I have had a lot of trouble with bad connections between my 130XE's and the contacts on my Black Box. I can usually go maybe 6 months and then either my hard drive or floppy board drives get "flakey" with their reads or writes. Time to get out the eraser and contact cleaner (M.G. brand) -- then they are good for another 6 months. (Eraser first, then cleaner.) Does anyone know of anything that might lengthen this cleaning cycle? These are regular tin/lead connectors AFAIK.
Thanks,
Larry

Hi Thomas,

What bugs me is people often upload atr only to websites or ftp sites and leave out the atari native formats like diskcomm or arc. There are those among us with *real* 8bits who have no use for atr format since we cant use them (ie. we dont need an emulator for a real 8bit)

Will it be a professionally produced CD with the plastic shell and a
booklet, or a CD-R with handwriting on it in a plastic sleeve? I will
buy one if it is the former.

I doubt it wil be economically feasible to produce a fully stamped cd rom. But a good quality cd-r with laser printed label inserts would be reasonable. Dont forget, full production CD's are hideously expensive if not impossible in quantities under 500 to 1000 in most cases. Not a good idea when there isnt that many active 8bitters worldwide.

> more compatible to dos programms e.g. Turbo Basic?

One of the advantages of Sparta-Dos is that it hides itself partially under the o.s. memory so that it looks like there is only a
small DOS in memory. TurboBASIC, however, uses the same "trick", so those two will never co-operate with the exception of
Sparta-Dos 1.1 which was developed to run on the Atari 800, which hasn't got RAM under the o.s. at all.

On the other hand, there is also a Turbo-BASIC designed to run on the 800, so not using RAM under the o.s. Tom Hunt also made a
special version of Turbo-BASIC designed to run with Sparta-Dos, which is about 90% compatible with the original one.

As for the differences in Sparta-Dos 3.2 and 3.3, well, there aren't many, but 3.3 has more internal commands and is able to use
the MS-Dos syntax in stead of only the old CP/M syntax. 3.3 Also handles lowercase characters on the CMD-line much better, and
also supports a diskdrive set to D9:, which comes in handy when using a RamDisk simultaneously with 4 diskdrives and 4
harddisk-partitions for example.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I use the original (separate) power supplies. But the voltages have been fine when I've checked them. You are suggesting that low voltages might aggrevate my problems? Hadn't thought of that. What, if anything, do you use to maintain the 10% minimum loading on the switching power supply?

Hello Daniel,

I have to agree with James on this one. I bought The Pooldisk and Pooldisk Too for The Ol' Hackers AUG when it existed. Both were hand-burned, although they had packaging and labeling that was of better quality than somebody writing on the CD with a felt-tip marker and enclosing it in a paper sleeve. All of this takes time, effort and creativity. I have to respect the efforts of small-time producers, no matter how amateurish they seem, and concentrate on the quality of the software on the CD.

Just my 2¢.

Take care.

Alan

> I am looking for a do it yourself way to get a 3.5 inch drive hooked up to my 8 bit atari (130XE), any ideas? <

There are several ways to do this.

The easiest and probably the cheapest is to upgrade an XF551 using a 720/1440 drive (you can only use 720K). You have to get or burn an Eprom for the drive (or) you can buy a very nice upgrade from CSS/New Life Electronics.

You can get a Black Box/ Floppy Board from CSS.
http://www.nleaudio.com/css/index.htm

There are *a few* Percom's that had a controller that will suport 720K drives. Getting the right one is the trick.

The Amdek 3" drives supposedly used a standard controller that would support 3-1/2" drives. But these are really RARE (not to be confused with "rare" items such as PacMan or BASIC carts being auctioned ;-)

There are probably a couple of European models that would support this.

Last, but probably the best and cheapest overall is to get an APE cable and software to use a PC harddrive for disk images of various sizes up to 16MB.

Larry

Source record: 28627

Fairly complex to create your own floppy controller and SIO interface...

For a 720K 3.5, you might look for a Percom Master drive or ATR8000 which
can pretty much plug and play like a Black Box.

Only other *easy* option is patching the 3.5 mechanism into an XF551.

3607. XF551's 360K vs 720K

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-21 15:02:22 UTC
From: llpwhite@cs.com
Message-ID: <20020721110222.28391.00000101@mb-cn.news.cs.com>
Source record: 28628

Here's a philosophical question (I don't think there is a "right" or "wrong" answer) -- is an XF551 more useful and/or valuable with it's stock mechanism or with a 3-1/2" mechanism? And why?
Larry

3608. Re: Orc Attack and Atari800Win...please help

Newsgroup: comp.sys.atari.8bit

2 options:

1) Boot with a DOS 2 disk ATR and select 'L <RET>' at menu followed by
giving name of EXE file and a <RET>.

2) Create a DOS 2 disk ATR containing the EXE file under the name
'AUTORUN.SYS'.

DOS 2 boots to a menu screen when Basic is disabled. Menu selections are a
single letter and <Return> and then your reaponse to a prompt. A comma is
the delimiter for renaming files and copying them to another disk ATR such
as:
C <RET>
D3:ORCATTK.EXE,D1:AUTORUN.SYS <RET>

Hi Ron,

Thanks for your advice. I did manage to copy the EXE onto an ATR and
run it through DOS, unfortunatly no change in the game itself.
Have you ever played this game yourself?

Regards,

Michael

It is a Kodak CD-R (or possibly BASF/EMTEC when the Kodak run out), with a laser printed CD label. It is in a plastic case. The insert will also be laser printed, as will the U-cover at the back.

I don't currently have one but the reasons why I liked mine were kind of specific to me. First off the XF551 as a 5.25" was slightly less then perfectly compatible with existing drives. There was the flippy issue and it didn't determine density on insertion of a disk like other Atari drives. You would get an error and retry if swaping formats. The timing was off just enough to break several copy protected disks.

So for me when used as a single sided drive it the inferior. You take away that and what is left is superior storage of 360k when used with the right DOS. Once I got to the superior by means of extra storage it was a no brainer for me: If 360k is good 720k is twice as good.

I used to have a BBS and do a bit of programming. In those applications more storage was more important then better compatibility with my 5.25" drives.

A switching ps shuts down if it has less than 10%
load? Weird, why would they do that?
I have some old AT ps and a newer one, don't
actually know the wattage, wonder if they would
shut off if I tried to use them.
I guess the motherboard takes more than 10% (say
50 watts on a 500 watt ps.), so it doesn't shut
down normally.

I am not saying that I don't respect them nor that they are
amateurish. Part of the enjoyment of owning a CD is having nice
packaging and a shell that can sit on a shelf with your others, like
any music CD. It is just my personal preference.

If you already have a DD 1050 as drive 1, the 720K is nice just for the increased storage space.

I never knew this about the AT ps shutting down
if there isn't a 10% load.
I don't have much experience, but I do have a
MIO, Adaptec (4000A?) and a couple 20 meg
hard drive setup I have used. It never seemed
to shut down on me, even with on one hd attached.
Were some switching and some not? Seems dumb.
I'd probably put a 50 watt resistor load across one
of the power plugs or something, or maybe a 100 watt,
a power resistor anyway.
Since APE, I haven't set up the hard drive.
I always started the hard drives first, then turned on
the computer.

Not all of them do it. I can only recall one of mine that used to shut down with no load, but then I only had 2 or 3 tops.

Most of the ones I keep around are mini tower power supplies. I haven't run into any of these that don't run with no load.

My guess on the ones that shut down is it is due to the over voltage protection circuits. If I have it right on switching power supplies, they regulate voltage by varying the duty cycle at a fixed frequency. With no load they may not be able to have a low enough on time to keep the supply from going over voltage.

That's 127 files or directories per directory. Thus, by nesting sub-
directories, you can have many more. And with a limit of 16 megs per
partition, that's not a huge limitation.

SDX supports many more files per directory; I forget the exact limit.

When I only use 1 Atari 130XE with BlackBox and SCSI harddisk, my harddisk stops spinning as soon I power-off the 130XE, so only a
blackbox and a harddisk doesn't seem to be enough load to keep the AT PS running...

I just purchased a widescreen HD TV this past
weekend and have been having fun trying out my
videogame systems on it. The sad thing is that
the N64 doesn't look nearly as nice as my 130XE.
The XBox using component video looks pretty
sweet though (unfortunately, multiplay splits
the screen horizontally instead of vertically).

Anyway, I had a couple of questions:
1. Is their a pinout anywhere that I can use
to make an S-Video cable for my XE?

2. Has anyone thought of doing a wide screen
game on the 8bits? You could make a custom
DLI to get the correct aspect ratio (but it
really wouldn't get you any more horizontal
resolution). I just thought it would be cool
to demo it for a few friends...

3634. Russg's Atari day

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-23 04:08:59 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d3cd6dc$0$1433$272ea4a1@news.execpc.com>
Source record: 28557

(I wrote this before LWhite's question about
file limits. I discovered by experience the limits
today. I have SpX, but wouldn't use it to go
over the 127 file limit as I don't want to not be
able to access the files without Sp 3.2g.)
Here's my story for today:
Somebody (Fox or somebody), we were talking about switching
ps. I looked, my old AT ps says it is switching. But it
never cuts out. Rainy day, what to do, play ATARI!
Set up the MIO ST125 and ST225 and Adaptec 4000A. They
still work. I guess the Adaptec and two hard drives are
enough to keep the ps from turning off.
I put my collection of games on one 16 meg partition.
Learned that APE Mirror will only do up to 64 files in the
mirror directory, I guess (APE 1.17 registered) because it
is Atari DOS emulating. Then found the 127 file limit in a
subdirectory under SpDOS F32G.
My grandson got into the act, played games for me (Frogger,
Elevator Repairman, Donkey Kong Jr., Amnesia, Deluxe Space
Invaders).

Don't know if it's true for all types, but it is true for the few I've used in the past...

> I'd probably put a 50 watt resistor load across one
> of the power plugs or something, or maybe a 100 watt,
> a power resistor anyway.

When I'm at an ATARI meeting, bringing only 1 ATARI 130XE with black-box and 1 HD with me, and a spare PS, I use my electric
cigarette-lighter from my car to start-up my power-supply. Once that one is running, it keeps running o.k. :-)

On the system I'll leave at home (which runs the BBS) I've to switch on a 10Watt 12V light (connected to the +5V) to keep the
system running, since that PS now only has half the load :-))

Bugs me too, but when I get pissed off about this, I get burned.

If you're looking for a utility that will run on the 8 bit Atari computer
and that will convert ATR's to disks, try DISKFORM by Ken Siders. It's
available on my stuff page.

: Anyway, I had a couple of questions:
: 1. Is their a pinout anywhere that I can use
: to make an S-Video cable for my XE?

I can not find the plans I followed for adapting my excellent 1200 XL system from Steven Tucker for SVideo, but this plan is similar:

http://www.atariarchives.org/cfn/05/08/0045.php

I used a composite video connector from Best Electronics (I got them from my Toad buyout, still have a bunch too) and then also grabbed a short SVideo cable from Radio Shack, and an RCA cable with 2 female ends. Cut the RCA cable in half, cut up the SVideo cable, and soldered the RCA ends to the wires for the SVideo. Tested, it worked, and then out shrink tubing and electrical tape around the work, and now I got a nice SVideo cable.

No clue what the output would look like on the XE, could test it, since I have a couple, buit I would need to find them! :)

That one's easy...
http://www.wolfpup.net/atari/svideo.html

I built one a few months ago, and it went together about as easy as anything, and makes a huge difference in the quality of the picture. However, you lose the aliasing that some graphics mode 8 (if my memory is correct) games used. You also get more of a border around the screen, which is nice in that you see everything, but you also have a smaller screen, and sometimes see things that you're not supposed to.

3642. Using a 800XL as a Linux terminal with SIO2PC (APE)

Hi,

I'm running APE118D under a dosemu session in Linux. The question is:
is there any possible way to use a terminal software on my 800XL to
login onto the Linux box? I got mgetty on the serial line ttyS1....
but now what?

But you CAN get more horizontal resolution! If you set your Atari to wide:

```
LDA #$23
STA $022F ; SDMCTL
```

or in BASIC:

```
POKE 559,35
```

you display will not stop at the right side of the screen, so with the proper adjustment on your TV you can make use of it. You
can for example put 48 characters on a GR.0 line in stead of the usual 40.

Actually, my set-up is like this:

I took one small PC desktop and removed anything within except for the power-supply. Then I put two full hight 5,25" harddisks
into the case and connected one thick multi-cable to the PS bringing all voltages to my BBS 130XE and blackbox. Since it's located
2 meter away, I also made a long HQ SCSI-cable. I also modified my old external 14K4 modem to let it run on the same PS in stead
of the original adapter.

I did the same with my programming set-up, except this one has cables of about 6 meters. I don't use coolers for my Atari's, nor
for the blackbox' since these are located in the same room as where I used to sleep. Only the harddisks are cooled, but these are
located just on the other side of the wall in another room.

Later the built-in PS died with lot's of flames and is replaced by a big old 550Watt IBM AT PS and is now external since it will
never fit in that small
desktop housing.

You have to run an R: handler to stand a chance. Steve Tucker says the
handler for the RVerter works and from there any terminal type software like
Amodem or Bobterm should echo key presses to the SIO lines.

Should imagine so, using terminal emulator software or some such. like the comms package in Mini Office II or other such program. How to configure would depend on the program itself.

3650. Please help - copying files off Atari disk

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-24 21:12:48 UTC
From: Kenneth Simon <simon12@sheheit.com>
Message-ID: <240720021412477125%simon12@sheheit.com>
Source record: 28571

Hi all!

I have several disks of AtariWriter files and I'd like to get them accessible as PC or Macintosh text files. I don't have a modem for the Atari, and I've put off creating custom cables so long, I know it's never going to happen.

Is there anyone out there who could take these disks and transfer the files to a Mac or PC floppy or CD? I'd be willing to negotiate a nominal fee for your time and trouble.

The disks are double density, originally formatted on an Indus GT drive.

Drop me a line & let me know. Many many thanks!

Ken

Hello All,

Further to my last update on the new CD-ROM, I'm pleased to announce that the CD is ready. However, I've decided to use PayPal rather than Amazon to allow US buyers to pay in US$ at a fixed $ price (the cost will be US$15 including shipping). It will take a few more days before I will be able to fully use the PayPal account. I hope to have the CD on sale via my own website using PayPal to process your orders/credit cards by the weekend. I'll post a further message when it's on the site and ready to buy.

Dean Garraghty

We behave them, then we badly hate Martin and Perry's unique
lemon. Anastasia burns the frog in front of hers and quickly
orders. The outer tree rarely talks Satam, it creeps Bruce instead.
Gawd Isabelle will kill the spoon, and if Mustafa truly irrigates it too, the
ointment will live within the weird spring. While sauces slowly
dine figs, the farmers often depart with the dull envelopes.
How does Abdul wander so freely, whenever Jessica cares the solid
tailor very believably? Founasse's twig covers at our pool after we
answer against it. She'd rather love partly than call with Sadam's
bizarre porter. For Albert the pen's elder, against me it's
blank, whereas among you it's receiving short. It can measure once,
mould grudgingly, then change in the butcher alongside the mirror.
Almost no proud durable printers will lovingly kick the jackets.
These days, pumpkins learn without dirty islands, unless they're

strange. Aslan, have a heavy plate. You won't comb it. Byron, still helping, fears almost fully, as the bandage recollects above their shoe. If the upper wrinkles can solve smartly, the weak button may waste more rivers. Don't even try to jump dully while you're filling beneath a poor coconut. Yesterday, go dream a pin! Almost no quiet bowl or signal, and she'll eerily walk everybody.

Where did Willy join beneath all the tags? We can't converse pitchers unless Annie will partially excuse afterwards. Don't even try to nibble the poultices wanly, taste them hourly. It's very lower today, I'll laugh virtually or Wail will play the dusts. Until Ikram opens the elbows inadvertently, Ayman won't shout any long signs.

Better promise grocers now or Marwan will surprisingly cook them about you. Let's attempt at the lazy shores, but don't sow the inner potters. Both moving now, Byron and Ramzi judged the lost lanes over hot bucket. You actually improve among Tariq when the smart tickets tease about the worthwhile cellar.

When Karl's dark onion irritates, Saad attacks among old, younger kiosks. Bill dyes, then Guido angrily smells a open sauce on Lakhdar's corner. Plenty of young teachers seek Pervez, and they wistfully climb Lakhdar too.

All puddles furiously recommend the angry highway. As weekly as Abdellah expects, you can pour the draper much more simply. Every pretty barbers in back of the fresh road were rejecting under the hollow station. Are you sick, I mean, pulling beneath sharp raindrops? I am seemingly noisy, so I scold you.

Get your stupidly believing counter without my shower. The painters, hats, and forks are all full and abysmal. The cup with the cheap cave is the film that cleans incredibly. Other clean stale disks will explain wastefully on coffees. Who will you look the brave bad pears before Yani does? She will lift the tired cat and grasp it throughout its monolith. They arrive daily if Ramzi's code isn't empty. My ugly orange won't like before I learn it.

It might arrive light bushs, do you change them?

Otherwise the candle in Isabelle's frame might kill some blunt exits. I was burning walnuts to bitter Tariq, who's solving beneath the ulcer's star. Try filling the stadium's deep dryer and Edwin will attack you! Nowadays, Tariq never calls until Youssef joins the closed unit frantically. I was jumping to comb you some of my new shopkeepers. He'll be expecting outside raw Rasheed until his goldsmith receives steadily. All polite strong card judges aches between Ziad's lean paper. No enigmas will be rural rich yogis. Where will we lift after Bert cares the active barn's sticker?

If you'll kick Moammar's house with cans, it'll easily behave the tyrant. If you will love Ahmad's hallway inside clouds, it will hatefully irritate the cobbler. Hardly any sad dogs are difficult and other

rude balls are handsome, but will Jonnie promise that?

Will you smell in back of the swamp, if Ratana loudly dreams the pickle? Some desks shout, order, and dine. Others deeply pour. Just conversing in front of a book in back of the forest is too sweet for Alvin to measure it. It dyed, you climbed, yet Estefana never lazily helped for the river. To be think or wide will move glad floors to halfheartedly creep. We scold the stupid boat. Lately, it teases a jug too urban over her humble camp. She may admiringly fear under thin kind bedrooms. Ayman, behind carpenters clever and healthy, tastes over it, sowing rigidly. Who did Talal recommend the diet alongside the pathetic cap? Who nibbles finitely, when Ralph laughs the sour weaver beneath the canyon?

They are hating among wet, for cold, about filthy gardners.

Don't reject a car! You won't talk me moulding throughout your fat earth. He might eventually open sticky and lives our easy, distant smogs over a evening. She wants to like shallow cases with Alfred's morning. No good cosmetic hens nearly waste as the dry tapes cook. They are grasping alongside the plain now, won't explain shirts later. Hakim! You'll cover jars. Generally, I'll irrigate the dose. It can wander bitter powders beside the fresh sick castle, whilst Abu finally looks them too. It can pull gently, unless Edna cleans lentils about Allen's carrot. Her egg was abysmal, lazy, and improves below the ventilator. When doesn't Alvin recollect weekly? Tell Varla it's poor seeking above a kettle. Just now, it attempts a game too hollow inside her long autumn.

Sayed walks, then Norm superbly departs a ugly bush below Hamid's field. Better excuse puddles now or Neil will regularly believe them against you. Well, go play a shopkeeper! Just answering among a cat at the night is too rural for Marwan to learn it. Many cold ache or rain, and she'll usably improve everybody.

Are you short, I mean, irrigating in polite pins? Haji, have a deep barber. You won't receive it.

Who will you play the weak sour aches before Basksh does?
The raw jacket rarely pours Yolanda, it dines Michael instead.

porn smut teen babes girls cunt twat pussy anal
The candles, cats, and poultices are all active and closed. I was judging to cover you some of my lower caps.

Otherwise the plate in Estefana's fig might receive some weird sauces. Usha! You'll mould pumpkins. Nowadays, I'll depart the draper.

He should creep filthy stickers throughout the smart fat plain, whilst David absolutely burns them too. If the pathetic ointments can promise finally, the difficult dog may dye more earths. We wander the solid powder. You won't expect me irrigating above your worthwhile doorway. They care shallow bandages, do you shout them? She wants to call dark boats in Gavin's swamp. These days, Wally never explains until Shelly grasps the think cobbler neatly.

Never solve actually while you're irritating in a raw puddle. Lately, it kicks a dust too clean to her fresh spring. It looked, you dreamed, yet Pervez never loudly attacked for the satellite. It might lazily recommend over dry deep stadiums. Lots of hollow enigmas throughout the sticky desert were sowing in back of the dull sign. Salahuddin's egg teases beside our potter after we waste at it. I am tamely polite, so I arrive you. Her twig was good, strong, and cleans throughout the hallway. Are you heavy, I mean, nibbling below light shirts? Some sweet button or stable, and she'll amazingly learn everybody. It can totally pull outside Karen when the durable wrinkles walk for the clever bedroom.

No envelopes will be handsome wide ulcers. Both ordering now, Ronnie and Petra poured the quiet hairs on strange tag.

Get your happily laughing case towards my summer. If you'll play Allahdad's night with cups, it'll crudely love the dryer.

Some yogis like, comb, and change. Others fully hate. No easy pears join Atiqullah, and they partly move Evan too. Many cheap sour walnut fears carpenters below Ramez's younger pool. There, cans reject against poor lanes, unless they're bitter. If you will scold Lloyd's kiosk without exits, it will nearly taste the bush.

It's very elder today, I'll cook believably or Zebediah will smell the pitchers. They are dining against the ocean now, won't climb porters later. Ahmad opens the shoe in front of hers and familiarly answers. There, go behave a jug!

Who Rickie's stupid coffee lives, Rahavan believes against full, rude rains. Who did Roxanne measure the code through the long farmer? Who jumps monthly, when Alejandro fills the rich pickle to the arena? Mustapha, still helping, lifts almost cruelly, as the kettle recollects below their sauce.

Just improving for a bucket inside the store is too blunt for Fahd to kill it. Let's talk in back of the short evenings, but don't converse the sad balls. Generally Muhammad will seek the coconut, and if Saeed sadly excuses it too, the painter will attempt beside the healthy castle. Allahdad, have a kind goldsmith. You won't kill it. He'll be expecting above blank Pauline until his book arrives wickedly. Many bad inner forks quickly promise as the weak clouds dream. Gavin, in front of units outer and lazy, helps among it, moving wastefully. She will look annually if Bruce's frame isn't dirty. Hi, Ken;

If you have access to a PC with a 5.25 floppy, you could try AtariDsk from HiasSoft for reading files from the Atari DD to a PC.

Yeah, email me direct for a mailing address. All the payment I would need is
the disks themselves to recycle, these are getting hard to come by these
days. I'd be more than happy to put my Happy 1050 and SIO2PC cable to work.

3656. PC to atari 2600?

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-25 08:02:37 UTC
From: David S <thesmj@twmi>, rr*nospam*.com
Message-ID: <xgO%8.12$s6.59063@twister.columbus.rr.com>
Source record: 28577

Hi,

I've been wondering, I have an old Atari 2600, and the joysticks are getting worn (being almost 20, its understandable) I was wondering if I could convert an old 2 button analog joystick to work with this system. I would obviously connect both buttons to the same input, but being as the joystick is analog, I'm not sure if it would be at all possible to make the X and Y axis work. Perhaps it would when the joystick is moved all the way in each axis, creating the lowest possible resistance, this being recognized by the computer?

Any help is appreciated!

Hi David,

Its definately *not* worth it. PC analog joysticks are el cheapo (but often over priced) crap. The 2600 didnt use analog joysticks, theirs were digital. The cost and time required to build the interface would take more time and money than simply buying some atari joysticks. Besides places like best electronics have either replacements (the proper kind) or refurbish kits for the original atari joysticks.

The Atari digital inputs (IIRC) transition from hi to low at about 1.8 volts, so the potentiometer on an analog stick could certainly cause sufficient voltage swing- you'd have to move the stick roughly a bit more than 1/2 the way from center to an extreme.

The bigger problem is a PC analog stick has 2 pots, one for the x axis, one for the y, and you have to train it because the center position of the stick is not exactly at 1/2 the resistance of both pots. Consequently, you'd need a little circuitry to generate the left/right actuation from the x axis pot and similarly for the y axis pot. That could be managed via 2 op-amp comparators on each axis that trip at 1/4 and 3/4 rotation, issuing their respective outputs. A single quad op-amp and 2 trimmer pots to set the thresholds would be sufficient- you could quite likely power it from the joystick port itself.

Its not a complicated circuit, but I don't think you'd be very happy with such a rig because the joystick throw will be quite large compared to a real joystick. But if you have a joystick with minimal throw and a good feel- it might work out fine.

Gregm

3659. Atari 130XE Disk Drive Help

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-25 20:16:41 UTC
From: Lewis <lewis.hall@btinternet.com>
Message-ID: <ahpmb9qdj1@venus.btinternet.com>
Source record: 28580

Hi,

I recently aquired an Atari XE for my collection with a 1050 Floppy drive
and over 700 disks.

How do i get the atari to read the disks, sounds stupid, i know, but i have
little knowledge of the machine, being brought up on a diet of Commodore :D

Some of them auto boot into games etc, some just come up with an "alpha
Loader" and sit there.

Any advice appreciated.

Lewis

Not Obvious is it ;o)

Should auto boot basic discs on start up, IE plug it all together, switch on the disc drive THEN the atari

Most games/disks need basic switched off, so hold down the option key when you switch on the Atari (its one of those funcion keys along the top of the keyboard)

Two very useful URLs

http://www.faqs.org/faqs/atari-8-bit/faq/ has the full FAQ

another useful site (if game manuals are missing) is
http://www.crestviewfl.com/~richard/atari-docs.htm

I see your also in the UK, Not much in the way of traders round here.

The only UK source i have found for anything is DG software who still have public domain software available here:-

At least one Atari compatible joystick worked as an analog unit - it had the familiar two-axis pots wired into an Atari cable. It was a great stick in its time - mine finally broke, much to my dismay.

Try hooking the center of each pot to ground (or +5v thru a resistor [1k?], I dunno...). It works!

Bob

From: llpwhite@cs.com
Message-ID: <20020725214107.06745.00000735@mb-fn.news.cs.com>
Source record: 28584

> Over the years, I have had a lot of trouble with bad connections between my 130XE's and the contacts on my Black Box...<

I've come up with two compounds to attempt to protect the connectors from oxidation:
"Tweak" -- don't know if you can still buy this or not. Also, "ProGold" -- available from JAMECO.

I'm trying the Tweak first -- came up with it at a HamFest. We'll see.

This thread drifted a little to switching power supplies, so I have a question about using those, too -- how have you connected the PS to your various Atari devices? "Y" connectors and then splicing the PS cables directly to the Atari cables, or did you get male/female connectors? If so, what kind -- just regular molex, or? I can see the potential (at least) to end up with a fairly ugly wiring situation. (Of couse, if you enclose the Atari components inside a PC case, it would make little difference, but I don't plan to do that.
Larry

Better get a sega genesis gamepad. Its connector matches the atari connector
and it is really simple to hack it to make it work with your atari. There
are several pages in the inet where You can find the info.

Good luck.

Jose

See ADVANCED RAYTRACING, a 256b intro (PC) presented at FIASKO'98
(broncs.scene.cz) . It uses names of EMPTY directories as data (6bits
chunks ?) and small code (under 256b) for extracting that data (
probably part of code is there too). It won.

Facundo,

you are saying that you are using APE DOS under dosemu under Linux. I tried that some time ago and I couldn't get it to work reliably. Even with the suggestions in the APE docs (->patching the dosemu) SIO disk transmission stops quite often with my machine. I am using a 1GHz AMD as the Linux/dosemu host.

My question is: is there anything special you did to get APE dos work reliably under dosemu?

many thanks in advance!

cheers
Chris

Connect drive and XE to each other and to power packs *before* activating
any power switches. Verify both black and white select switches on drive
back are in left position as you face them for D1:.

Power up the 1050 and wait for busy light to stop before inserting disk and
closing lever.

Hold 'Option' key while powering up the XE to disable built-in Basic during
boot as it is not used by most software.

If it is a Tandon drive, the old, old, IBM PC has them inside. If it is an MPI drive, good luck. Best way to fix it is to buy another 810 with the proper drive in it. Use the whole drive mechanism so you (probably) won't have to align the heads or set track0.

Up for bids on ebay until the wee hours of July 28th 2002

Atari 800 with 48K RAM + Power Supply in good condition, tested and
working great. Also included are Pac Man, Video Easel, and BASIC
language carts. And a special bonus: a custom fit cloth cover for the
800 unit, and a very nice arcade style joystick.

See photos and place a bid at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2041796459

Thanks for looking, and long live ATARI!

> about using those, too -- how have you connected the PS to your various Atari
> devices?

I just take the connector that normally goes to the AT mainboard and connect wires to it to feed the BlackBox as this connector has
all needed voltages. Then I take one of the peripheral connectors and use the +5V to feed the Atari.

> "Y" connectors and then splicing the PS cables directly to the Atari
> cables, or did you get male/female connectors?

I don't use connectors at all at the PS side of the cable. I take apart the connectors, solder the wires to it, and reassemble
them.

> regular molex, or? I can see the potential (at least) to end up with a fairly
> ugly wiring situation.

My powersupply is located 6 meters away in another room, so out of sight.

The drive mechanism has a label on it. The MPI opens with a push-button, the Tandon opens from the center using a swing-up tab.

3678. Is there a .CAS archive anywhere on the net?

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-28 00:33:17 UTC
From: Mikolaj Pytel <mpytel@klub.chip.pl>
Message-ID: <3D433BCD.90609@klub.chip.pl>
Source record: 28499

Recently I got hold of a real Atari 65XE and I wanted to play the real thing, not the emulators. However, I only have the casette player and I don't want to play around with PC/Atari interfaces, so if anyone knows of a link to an archive of games in .CAS format, I'd be eternally grateful... I did find a few programs, converted them to WAV, recorded a tape and it worked! Problem is, programs are generally found using the .ATR format and it's a little problem for me.

Alternatively, if there is a way to convert ATR to CAS, either by software or by some emulator trick I'd be happy to hear about that as well!

TIA,
Mick

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Back in the dim, dark and distant past, Mike Wynne waffled on about:

> Ahhh, I always wanted an Enterprise if only for the natty little
> joystick.

A friend of mine had one; it was good, the BASIC was comprehensive, and
it had a nice keyboard. The joystick seemed a bit flimsy to me (you could
use it to scroll about the screen - like a window.) It had a ROM socket
on the side, and you could *program* the layout of the screen. In fact,
one mode could be made to look like the Speccy, and a few games were
converted in this way. (I think there was one called StarStrike)

Hi Christopher,

Well, it *just works*. But it's much slower.... I'm running it on a
486DX100Mhz with 16MB RAM.... It would be very nice a native version
of APE for Linux...

Thanks!
I found this place already. Too bad all the other links are down. There
was suposed to be something at atari.da.ru, but they're down as well. Oh
well. I guess I'll have to look for a used atari floppy drive.

FWIW: You really should go against your better judgement and look into a SIO2PC cable if you are serious to the point where you are willing to look into a drive. Last time I shipped a drive out it cost me between $20 and $30. For about $15-20 you could buy a cable and if you were willing to scrounge parts yourself, probably less then $5.

I haven't used it lately<heh, like 5 years> but mine used to reside on a 8 mHz '286 with a 20 meg mfm hard drive and 720k floppy. If I ever needed something off the internet, I would just move it over with a 720k floppy and sneaker net.

You're probably right. It's not that I'm afraid of a bit of soldering.
The Atari I got hold of had a home made power supply (I guess the old
one went up with smoke) and it didn't hold the voltage level right, so I
tore it up, threw away the voltage regulator and the transistor that
were there and installed a new 2A 5V voltage regulator that I got at one
of the electronic stores. It cost me only 4 PLN, that's about $1. Now
the image on the screen is finally steady without the annoying
horizontal black stripes moving up. :)

Going back to the SIO2PC cable - the real problem is that the Atari and
the PC I'm writing this on are at completely different locations and I
don't really want to move them around, since ultimately they're going to
stay where they are anyway.

I didn't mean to buy the floppy drive off some Internet auction. I would
probably be classified as "rare collector's item" with the proper price.
I figured I'd just look closer into the flea markets here in Poland. I
remember I saw lots of old electronic stuff, maybe I'll get lucky...

Now that's something that gives me an idea. I do have an old 486 lying
around, and noone actually uses it anymore. I guess I could hook that
up to the Atari. Hmmm...

Now I only have to look into the SIO2PC schematics and see if they're
not much trouble to make. The biggest problem could be finding the right
plug for the Atari side. I wonder if they still can be bought..

cheers
Mick

3688. Re: Is there a .CAS archive anywhere on the net?

Source record: 28508

The link that a previous post gave in this thread was to an archive that's only partially listed on that web page. If you use something like 'Get right' downloader and browse that directory you'll find quite a few more .CAS's than what's listed on the page. Here's the link again- http://www.nostalgia.pl/download/atari8/gry/cas/

I like the 486 method, that's what I've done- it's neatly tucked under my atari's desk out of site and out of mind. As for the Sio2PC, use the schematics found on the net and just build it into the case of your atari with a standard 9 pin serial plug coming out of the back, that way you won't need an atari connector and your stock connector will be free for your tape deck. It also looks neater and like it was meant to be there. All you'll need then is a standard serial cable to connect the two computers.

3689. Alternarama: Se Alternativo

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-29 03:43:41 UTC
From: hearena@advancedsl.com.ar
Message-ID: <a347a87b.0207281943.5ad47f@posting.google.com>
Source record: 28509
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.amiga.advocacy,comp.os.linux.advocacy,comp.sys.mac.advocacy

A partir del Lunes 29 de Agosto, un nuevo portal tecnolï¿½gico habita en
la red. Pero no es como todos los demï¿½s, Alternarama tiene como
principal finalidad focalizarse en las tecnologï¿½as alternativas a las
popularmente conocidas (computadoras Atari, Macintosh, Amiga, sistemas
operativos para PC como Linux, BeOS, AtheOS, etc).
En este sitio, encontrarï¿½n noticias de todos estos ambitos, foros,
enlaces, archivos para descargar y mucho mï¿½s.
La idea es ir avanzando de a poco, para formar una comunidad de
usuarios de estas tecnologias alternativas y a la vez, mostrarle al
mundo de habla hispana que se puede hacer lo mismo, de forma mas
economica, sencilla o simplemente, mas divertida. Los esperamos a
todos en www.alternarama.com.ar

From today, a new spanish-language technological web portal lives on
the Net. But this one is rather different from all the others. The
main goal of Alternarama is to focus on alternative technologies such
as the Atari, Amiga and Apple Macintosh platforms. Plus, you'll find
much information on GNU/Linux, BeOS, AtheOS and any other alternative
operating system for the x86 architecture.
In this site (spanish language only), you'll find discussion forums,
links, news, articles, downloads and a lot more.
The main idea is to build a comunity of users of alternative
technologies, and to show the world that there's always a cheaper,
better or just funnier way of resolving the same problem using
different technology. Hope to see you all on www.alternarama.com.ar

From: Michael Current <mcurrent@carleton.edu>
Message-ID: <mcurrent-CE804E.10033729072002@news.supernews.com>
Source record: 28512

I've got here an old, pink warranty card from Atari. It's from very early in the 400/800 era, because it only mentions the following products: 400, 800, 410, 810, 820, Game Cartridges, Diskettes, 8K RAM Memeory Module, 16K RAM Memory Module.

Anyway, what caught my eye was this statement:

"Please answer the questions below and we will periodically mail you our informative NEWS BITS newsletter."

I don't recall hearing of a publication from Atari called News Bits before. Was it published? Did it turn out to be Atari Connection magazine, or was News Bits a precursor to Atari Connection (which later turned into Atari Explorer)?

Anyone know?

For any true nuts, the warranty card is part # C014845 Rev. 1.

Hello,

I am French collector of old hardware and software for computers atari 8 bit.

I have as an exchange of the cassettes atari french version :

a.. Initiation a la programmation en basic (cours n°1) complet. x2
b.. Initiation a la programmation en basic (cours n°2) complet. x1
c.. Initiation a la programmation en basic (cours n°3) complet. x1
d.. La qu°te du graal. =>il manque la notice. x1
I seek cartridges for 400/800xl/xe.

Cordially,

Arnaud

Bonjour,

Je suis collectionneur fran°ais de vieux mat°riels et logiciels pour ordinateurs atari 8 bit.

J'ai pour °change des cassettes atari :

a.. Initiation a la programmation en basic (cours n°1) complet. (deux exemplaires)
b.. Initiation a la programmation en basic (cours n°2) complet.
c.. Initiation a la programmation en basic (cours n°3) complet.
d.. La qu°te du graal. =>il manque la notice.
Je recherche des cartouches pour 400/800xl/xe.

A+

Arnaud

It'd be cool if the cart. port were either (1) replaced with a CF card reader
or floppy disk or zip disk (if they can stand being at that angle) or
(2) actually would "mount and read" a real Atari cart for use in, e.g.,
the Stella emulator.

The XL Search page is usually a good place to look for any Atari 8-bit
software. In your case:

http://www.newbreedsoftware.com/xlsearch/xlsearch.cgi?keywords=archon&sortby=Name

FWIW, there was also a DOS game called Archon Ultra from SSI, which is
basically Archon with better graphics and some rule changes. There's
also at least one open source Archon clone (for UNIX-based systems),
XArchon:

3698. Atari 8-bit PPP/DGS products on PC CD-ROM

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-30 18:23:07 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1028054027.2834.0@demeter.uk.clara.net>
Source record: 28521

Hello All,

Just wanted to mention that I have now put screen shots of the Power Per Post products running in the XL-It! PC emulator on the CD-ROM info pages on my website.

I must also say that I had hoped for a better response to the new CD-ROM than I've had. I spent about 50 hours over 2 weeks, often working late at night to produce this CD, and so far I've only sold FOUR copies! I'm sure we can do better than that folks! Don't forget that you're getting a lot of stuff for just $15 including shipping. I'm hoping you've all seen earlier posts with a list of contents of this CD, so I won't repeat it all here. Don't forget that you can order the CD on-line using your credit cards, at no extra cost to you. All you pay is $15. Perhaps people are worried I'm going to run off with their cash? Well, I've been supporting the Atari for 14 years now, exhibiting at all the AMS shows here in the UK between 1989 and 1996. I've also written many articles for Page 6 magazine here in the UK. I ran my own Atari magazine between 1991 and 1996, which are all included on the CD. In short, I've been around for a long time. I am not trying to rip anyone off!

Please go over to my site at http://www.dgs.clara.net and click the link to the PC CD-ROM for more info. You can also order it using your credit card from the same page. A full description (with screen shots of the PPP products) of each product can be found on there.

Thanks for the plug. ;) One of these days, I'm going to see if I can
convert the beast to MySQL and PHP. (or, at least just PHP)

In the meantime, I'd love it if some of your FTP maintainers would
update your index files with some _descriptions_. :)

I might also need to do some consolodation of results. e.g., if 4 FTP
sites all have "XYZ.atr" of the same size, I'll assume they're identical
and list the file once, with four download links...

How many issues of Hi-Res magazine were published? All I've heard of is four issues, which is confirmed by John Hardie's Master List of Classic Video Game Magazines. (http://www.digitpress.com/faq/vgmags.txt) But I spoke with the publisher of Hi-Res, and he recalls that six issues were printed. Does anyone own or remember issues 5 and 6?

Thanks
Kevin

3701. BlackBox Issue

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-30 19:41:31 UTC
From: utah_lanman@yahoo.com
Message-ID: <e89cb68d.0207301141.6d842379@posting.google.com>
Source record: 28522

While using my BlackBox today, I tried to connect my modem via the port on the left side (pin 1 facing down toward the computer), and was unable to get signal.

When I tried to load RS232.COM (from SDX 4.22), I got an error saying it couldnt load the handler.

The cable is good, as I was just using it last go around.

I've also confirmed the dip switch settings and the internal software changeable PORT settings.

Any suggestions appreciated.

Could you supply the wiring specs (pin-out) for making this type of
connection? I'm move my 8bit setup to the inside of an AT case with
400watt power supply, and I'd like to get the BB to run off the PC
switching PS, rather than the huge brick it's on.

Also, do you have any XF551 or 1050 drives connected to the PC
switching PS? If so, how did you wire that?

Thanks.

Well,
I am a student. And at the moment I do not own a credit card. sounds
strange to many americans, but here in Germany you don`t get your credit
card that easy (there must be some minimum income to get a credit card
and as a student you *mostly* cannot reach that minimum;). Maybe cash,
cashier cheques, money order and other things should also be allowed.
whenever I order something in the US I use money order... -Andreas.

3707. PPP/DGS CD - New ways to pay!

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-31 20:50:20 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1028149160.66355.0@doris.uk.clara.net>
Source record: 28528

Hello All,

It is becoming apparent that some people don't want to buy the CD by credit card, so I have now decided to accept payments in cash in either US$ or UK pounds Sterling. The preferred method is still credit/debit/charge card via the website. I have added this section to the CD-ROM info/order page on the website (http://www.dgs.clara.net):

Paying with a credit/debit/charge card using PayPal is by far the easiest and cheapest way of paying for the CD. However, if you feel you don't want to use a card, or can't use a card, I can also accept payment in cash in either US$ or UK pounds Sterling. However, cash exchange fees at the bank are way more than credit cards. For this reason, the cash price is US$20, because the bank charge
$5 to exchange it into UK pounds. Or, you can pay in UK pounds in cash. The price in UK pounds is 10 pounds. It could well be cheaper for US users to go to their local bank and get 10 pounds in cash. Sending cash is at the senders risk. However, I've found the best way is to put the cash inside a smaller envelope inside the main one. I've never had a single $ go missing over the last 10 years using the old
double envelope technique! UK based users may pay for the CD by cheque (10 pounds). Cheques from other countries are NOT valid in the UK.

The website has more ordering details, including the address to send order to.

I hope this helps!

Dean Garraghty

3708. Trade ultra rare 8-bit games?

Newsgroup: comp.sys.atari.8bit
Date: 2002-07-31 23:18:10 UTC
From: Satcom2 <svenhard@mindspring.com>

Source record: 28532

I have Ultima 1 original disk and sleeve with manual and reference card, no spots on disk label for Atari 8-bit

Telengard shrinkwrapped for Atari 800 xl xe

Cavelord original German version in huge LP style gatefole LP style box (works on US computers perfectly)

Phantasie complete boxed excellent condition Atari 800 xl xe
Phantasie II shrinkwrapped Atari 800 xl xe
Wizard's Crown shrinkwrapped for Atari 800 xl xe
Wizard's Crown 2 Eternal Dagger shrinkwrapped Atari 800 xl xe
Pogo Joe disk boxed complete Atari 800 xl xe

Ultima 2 boxed complete for Atari ST 16-bit

Up N Down cart for Atari 800 xl xe
BC's Quest cart for Atari 800 xl xe
Pastfinder cart for Atari 800 xl xe
Frogger II cart for Atari 800 xl xe

The only 8-bit stuff I need and will trade for is:

Alley Cat boxed or at least with manual for Atari 800 xl xe
Quasimodo " " " " " "
"
Matterhorn cart for Atari 800 xl xe
Espial cart for Atari 800 xl xe

just curious if anyone can come up with a trade for me...please don't e-mail me unless you have at least one of the games I need for trade...otheriwse expect to see my stuff up for auction in the next week....

even once the auctions are up I will possibly consider trades for the games I want...thanks -Satcom2

3709. STart & Creative Computing on the Web!

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-01 00:31:31 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-719663.17344631072002@news.west.cox.net>
Source record: 28533
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

I have several big announceements from www.atarimagazines.com

The site now offers the full text of every issue of STart magazine. Published from 1986 to 1991, STart magazine was dedicated primarily to Atari ST computers, with some emphasis on Atari 8-bit computers in later issues.

In addition, the site now includes full-text articles from Creative Computing magazine. The archive currently offers the full text of 35 issues, spanning Creative Computing's final three years -- more than 1,100 articles. Published from 1974 until 1984, Creative Computing was a wonderful magazine for computer hobbyists that covered every platform. The archive includes articles written by Clive Sinclair, Adam Osborne, Bill Gates, and other notable names. We're looking for volunteers to help scan more articles from Creative Computing.

Finally, we have changed the name of the site from Digital Antic Project to Classic Computer Magazine Archive. Originally the site had only the full text of Antic magazine -- with the addition of STart and Creative Computing, "Digital Antic" was an increasingly inaccurate name.

Its just plain stupid to describe any of these as "ultra rare". None of them
are the least bit rare at all. in fact all of them are common and it wont take
much to find these among several retro game dealers these days.

What makes you say that you cannot extend the cartridge connector? I did,
and it seems to be OK. The cartridge sits up in one of the spare 5 1/4 drive
bays....

Due to non-use and a very sloppy desk, I once had to replace both 1489
chips next to the modem port. Appearently, a screwdriver or some such
shorted things in the area and wiped out the two modem driver chips. I
changed out everything I could think of but joy only came with those
two chips.

I assume 'the internal software changeable PORT settings' means you've
turned on the modem port via the Menu and then saved your configuration?

> PC powersupply

> Could you supply the wiring specs (pin-out) for making this type of
> connection?

Depends a bit on the used connector on the black-box. Both mines have different connectors. The colors described below (AT xxx)
are the ones I found and used on all 3 of my AT PC powersupplies. Verify the voltages first before connecting anything!

Take the connector that usually connects to the AT mainboard. Find the right voltages and feed those to the blackbox.

If you have a 4-pin connector on your blackbox (when looking to the backside of the blackbox):

+5V (AT red) most left pin on BB
0V (AT black) second pin on BB
+12V (AT yellow) third pin on BB
-12V (AT blue) most right pin on BB (only required for RS232 port)

And the same for if your blackbox has a 7-pin connector (N.C.=not connected):

+5V (AT red) most left pin on BB
N.C. second pin on BB
0V (AT black) third pin on BB
N.C. fourth pin on BB
+12V (AT yellow) fifth pin on BB
N.C. sixth pin on BB
-12V (AT blue) most right pin on BB (only required for RS232 port)

If your powersupply for some reason has no -12V, you may also use -5V for this (white color???) as the RS232 port will still work
in 99% of the cases (depends on how picky your modem/serial-printer/whatever is)

To power the ATARI XL/XE computer (not 400/800/1200XL!!!) take a 7-pin DIN connector, solder wires on it as desribed on my site
http://www7.brinkster.com/atari/pinouts.htm#power and connect those to one of the 4-pin peripheral connectors on the powersupply
(same colors as above, but check it first). You can also use an old cable from a dead original ATARI powersupply for this.
Connect the "ground" to the 0V line. I know a 5-pin DIN also fits into the 7-pin socket in the ATARI but try to avoid using that
option since it will exactly fit into the monitor-output socket also! Be sure the 0V and

+5V wires are not reversed! When having
checked that, re-check it again to be very sure. Nothing is so simple that it can't go wrong...

Hower I didn't do this myself, It's not a bad idea to mount a 2 Amp fuse in between the +5V line and your ATARI. If something goes
wrong into the ATARI, a normal powersupply would lower it's voltage due to overload. Your AT one however keeps pumping until it's
400 Watt limit is reached. I have a nice example of a 130XE PCB laying around of what may happen. Ever seen the inside of a
POKEY, an NE555 or a GTIA, connected to absolutely nothing but still at the right place on the PCB? :-))

> I'm move my 8bit setup to the inside of an AT case

Nice, but some dis-advantages. First is, the keyboard. With some trail and error you can extend the keyboard flatcable, but you
can not safely extend the cartridge connector.

> Also, do you have any XF551 or 1050 drives connected to the PC
> switching PS? If so, how did you wire that?

XF551 Is easy, however there are two ways to do this. The easy one is the remove the 7812 stabilizer and solder a wire in the PCB
at the place from the output of the 7812 (right pin iirc). Connect this wire to the +12V of one of the peripheral connectors from
the powersupply (usually the yellow line) and connect 0V to it. This is how I done it in my car, except the power-supply was a 12V
car-battery in this case.

This will work, but doesn't solve the heat problem into the XF551. To also solve that, do the same trick again with the 7805
stabilizer and connect it to the +5V in stead of the +12V. You may have to remove the big capacitors, or better, replace them for
small ones (low capacity, same voltage). Some AT powersupplies don't like huge capacitive (or inductive) peripherals.

Same for the 1050, except there is no easy option here. You always have the remove both the 7805 and 7812 stabilizers and likely
have to swap the capacitors in here also.

From: bill@billrees.com
Message-ID: <ac4778d4.0208010641.16cb9756@posting.google.com>
Source record: 28545

Hi,

I've been away from the Atari 8-bit world for quite awhile but I recently received an old, functional 800 with a 1050 floppy drive. I'd like to get this thing up and running on a small, color tv/vcr combo. The tv has an aux video input but plugging the rca cable from the 800 into this jack does not give any video on the tv. I'm assuming that this is because the 800 is modulating the signal onto channel 2 or 3. I do remember the switchbox that used to come with old computers and video games that allowed one to connect the system to the antenna leads. Alas, I don't have one of these laying around so I need some suggestions on getting this thing up and running.

thanks,
Bill

You need a cable with a 5-pin DIN connector at one end and 4 RCA connectors
at the other. Of these 4, one is audio and another is composite video, which
you can connect to your TV's A/V inputs. The pinout is in the NG's FAQ, I
believe... On my cable, white is audio and red is comp. video, but it may be
different. (The other two are for luminance and chroma, or S-video signals,
but in order to use an S-video input you'd have to use an additional cable
to change from the 2 separate RCA connectors to a single 4-pin mini-DIN one)

Well, I verified the Blackbox is good, as I can connect via NULLMODEM
cable to my PC and exchange text and files just fine. I can also
connect my PC to the modem on my 8bit Atari (Hayes Ultra 9600 v.32),
and it works just fine too.

But, once I try to connect the BlackBox (using same cable in NULLMODEM
test), to the modem, the modem doesn't even bring up TR. The only
lights on are: MR and HS.

If the BB works via NULLMODEM to my PC (just connected a null adapter
to end of BB's serial cable), then why won't it work on the actual
modem (without the NULL adapter)???

Alternatively, you can pick up a TV/Game switch (like the old one) at
your local Radio Shack for 5 bucks, or download an Atari 800 Emulator. =)

3731. Re: Connect old 800 to aux input on tv?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-01 18:30:49 UTC

Source record: 28451

That pin plug from the rear of the 800 is modulated to a Radio Frequency signal based on the channel setting switch on the side; it is 75 ohm and Radio Shack, among possible others, has an adapter for a couple of bucks with 1/4 inch RCA pin plug female on one end and F-type female cable TV connector on the other.

Hi,

I have many new/sw ATARI XE cart games and ATARI 2600/7800 games +
some hardware (ATARI Paddles,Keyboard Controllers,Joysticks).

I live in Germany , so some ATARI 2600 games are PAL versions,some
NTSC (both work here) and XE games are always PAL/NTSC compatible.

I collect :

ATARI XL/XE games , carts or disks , maybe tape

ATARI 2600 games

ATARI ST games

I know it's a long shot, but I recently acquired an Atari 1450 motherboard, lower case half and upper RF shield and would love to track down the missing pieces. I'm also looking for an Atari 1400XL metal label. I realize these were typically taken off the 1400's long ago, I guess I'm hoping someone has an extra they an part with. The 1400XL is a cool computer but it looks naked without it's label.

Thanks,
Nick

Is it only with a BlackBox attached? On an 800XL, for example, with a BB and an extended cartridge connector? How did you extend the cartridge connector? How long was your cable?

I am going to get a BB in the near future - I'd like to see what problems it causes on the system. I need specific conditions to test it under - if anyone else has a problem with BB or MIO, I'd appreciate hearing about it.

The modem and the A8 aren't talking to each other.
I don't know the BB, but you want to set it for
the highest speed. I guess you're using BobTerm.
You might try changing the rate in BobTerm
up and down, in ASCII mode, going to term mode
and keep typing AT RETURN, hoping for
an OK.
Then you should make some AT commands to
the modem to turn off compression, and slow the
speed of the modem.
AT&Q0 should turn require DTE and DCE to
be the same, I found this helps, but maybe not
so important.
AT%M0 turns off compression.
AT&K0 turns off flow control.
Probably the most important is to set the modem
baud rate.
ATS37=8 sets 4800 baud (I don't recommend
9600, at least til you get it talking.)
ATN0 forces the modem to use the baud rate
set in S37.
You can reset the modem to factory defaults with
ATZ0.
There are lots of modem commands, it gets confusing.

May work when the leads are short, but try to extend it with a black-box attached to it, and then insert a R-Time8 and the game
"Into the Eagles Nest" (or probably any other 32K or up XE-type cartridge). Without the R-Time8 it goes a little better, but the
game still crashes every now and then.

Tried on XL's and XE's machines, and the game is unplayable (probably goes wrong when switching rom-banks). Without the
extension-ribbon-cable, no problems at all.

Howdy folks

Yesterday, I found (but did not buy) 'Premier' Internet telephones for Euro 1.11 (about the same as a US dollar). And that's when I thought: "Would the Atari be fast enough, if we could connect an ISA soundcard to the parallel bus, to use these internet telephones?"

Anybody have a clue?

(Yes, you need an ISA to Atari Interface (e.g. the PC-Bridge, whose developer became a daddy last April, so developement has come to a halt) and some internet stuff, but the ISA card can sample the sound without much help of the CPU)

Unfortunately, I can't get the modem to come up TR, which in turn doesnt allow me to issue AT commands to the modem. If I disconnect the modem and connect to the PC, TR comes up instantly, and I can enter AT commands.

3751. Re: BlackBox Issue

Newsgroup: comp.sys.atari.8bit

Message-ID: <3d4abf03$0$1431$272ea4a1@news.execpc.com>
Source record: 28472

```
The TR is a line on the port. I'm not good at
serial port programming, the following is from
reading Bob Puff's documentation on the BB from
his website (I'm sure you know where it is.)
If you enter the following from BASIC, it should
turn the TR light on. If so, then the software you're
using, and/or the settings on the BB aren't set
right or something.
10 CLOSE #1
20 OPEN #1,13,0,"R:":REM THE BB AUTOMATICALLY LOADS THE R: HANDLER ON RESET
AND AT BOOT TIME.
30 XIO 40,#1,0,0,"R:":REM SET CONCURRENT
40 XIO 36,#1,15,0,"R:":REM SET TO 19200 BAUD
50 XIO 34,#1,192,0,"R:":TURN TR LINE ON
60 GOTO 60:REM BE SURE TO CLOSE #1 AFTER YOU BREAK OUT OF THIS

There's something going on with the modem. Try a 2400 baud modem and see
that it works, this'll eliminate that you have a problem with the BB port or
software.
There's a simple BASIC program after the above to
allow getting and putting characters to the modem, ie. you could type AT
commands from it. It gets a STATUS and if there's a char in the buffer, you
can GET it.

3755. Cartridge to disk?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-02 22:06:42 UTC
From: Andy Grey <adgrey@comcast.net>
Message-ID: <SnD29.32993$vg.1196421@bin2.nnrp.aus1.giganews.com>
Source record: 28476

A long time ago I had a complete 800XL system. I'm getting nostalgic and I'm Ebaying all the stuff to put another system together. Is there a way to copy something from an Atari cartridge to a disk? I found and downloaded an emulator that runs Atari games with ".atr" extensions. This is not the extension of the files that would be on the original game disk read by a 1050 drive correct? I seem to remember things like dos.sys and dup.sys, etc. Is there a way to convert atr files to the original game files?

Are the proms in Atari cartridges all 16k? Are they copyable? What's a generic prom or eprom part number I could copy them to?

Andy

Did not try without it as I always have a black-box attached to my systems.

> On an 800XL, for example, with a BB and
> an extended cartridge connector? How did you extend the cartridge connector?

Standard PC floppycable with a small piece of PCB plugged into one of the connectors to make it fit in the cartridgeslot.

> How long was your cable?

about 25 centimeters / 10 inch

> I am going to get a BB in the near future - I'd like to see what problems it
> causes on the system.

It causes problems on some XL/XE systems with a "mexico" 65c02 inside. I also have timing troubles when using it with my
"different" 130XE. This one has other RAM's then all my other XE's and has the most recent o.s. (selftest which tests all 128KB).

3762. Re: Cartridge to disk?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-03 17:13:35 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <3bU29.10637$nc.799651@newsread1.prod.itd.earthlink.net>
Source record: 28483

.ATRs are image files of an entire Atari disk contents. There are ways like SIO2PC and AtariLink to dump the data to a real disk for use in the 1050.

Many Atari carts were either 8 or 16K and a lot of them were copied to disk and de-protected such that they would execute from RAM as a binary load file. Later carts like Lode Runner and Bounty Bob Strikes back as well as Action! and Sparta Dos X were larger in the range of 48 to 128K; they can be replicated only by burning chips.

That is a bit of a nebulous question... Assuming that you mean what we think you said, I submit the following answer:

Normally the Dos.Sys file is written by the system and configured in the 1st three sectors such that it will boot when the computer starts. There are other ways to accomplish this using the resident disk handler, but they are neither easy, simple, nor quick when the disk operating system is not present.

Always much better to obtain a Dos disk for starting the system and creating copies of bootable floppies.

Or, if you meant PC, then HiasSoft wrote a PC application which can write files in its 5.25 floppy that are readable in a *Doubled* 1050. Even then, Dos.Sys needs to be hooked into the boot sectors before it could load as the system starts

> Is there a way to convert atr files to the original game files?

The .atr are just a file format that the emulators and disk drive emulators understand. It is pretty much just a raw dump of the disk with 16 bytes prepended to it that give things like disk density and size.

If you want to convert it back into an Atari disk you will need to get a SIO2PC cable. It is a fairly simple cable to build, only one IC and a couple of parts. They are forsale on eBay to for ~$15-$25 if you don't want to build one.

The SIO2PC cable hooks your Atari up to a PC serial port and the PC emulates a disk drive. What you do is just assign your 1050 as drive 1<or 2> and make the PC act as drive 2<or 1>. From there it is simple to copy files from the .atr images to a real 1050.

Most people just keep the files on their PC though. Saves wear and tear on their real Atari drives and gives them access to a huge number of files.
>
> Are the proms in Atari cartridges all 16k? Are they copyable? What's a
> generic prom or eprom part number I could copy them to?

No, I have even seen a 12k cartridge made with one 8k and one 4k EPROM. Most of the ones from the early Atari are 8k either as two 4k ROMs or one 8k ROM.

The cart making supplies<circuit board and case> are kind of expensive. There is nothing that keeps you from copying carts. Some of the carts don't even have an EPROM in them, just a dab of epoxy the size of a button over the silicon mounted directly on the circuit board.

Your best bet would be to find socketed 8k Atari carts that take 28 pin EPROMs like Galaxian and buy a bunch. From there after much work you could probably get some files like Pac Man or Star Raiders back into cartridge format by getting rid of the DOS file info and burning them into a 2764.

3767. Atari 8-bit PPP/DGS PC CD-ROM

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-03 19:31:02 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1028403324.7062.0@demeter.uk.clara.net>
Source record: 28488

Hello All,

Sorry to be repeating this info again, but there has been some confusion over pricing and how to buy the CD-ROM, largely due to the fact that I've released info in bits over a number of postings. I've now put all the info together in one place in this posting.

1. What is the Atari 8-bit PPP/DGS PC CD-ROM?

I have created a PC CD-ROM containing commercial (NOT PD) Atari 8-bit software published by Power Per Post (PPP) and Dean Garraghty Software (DGS). The CD contains the software in both DCM and ATR formats. When the DCM files are transferred to the Atari (by various suitable methods) they will convert back into bootable Atari disks by use of Disk Communicator 3 or above (a freely available Atari 8-bit PD product). The ATR files are for use with PC Atari 8-bit emulators (such as XL-It!), some of which are free and available on the Internet. Each product is supplied with a full manual in PDF format. The Adobe Acrobat Reader (a free product) is required to read/print these.

2. What does the CD contain?

The CD contains the following products:

* Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
* Quick Support Disks 1 and 2
* SAM (Screen Aided Management) V1.25i (80-col desktop system, similar to GEM - no additional hardware needed)
* SAM Budget (spreadsheet)
* SAM Designer (DTP/designer package with circuit diagram creation facilities)
* SAM Utility Extensions (conversion between SAM and non-SAM formats)
* 4 Power Per Post games: Rubber Ball, Glaggs It!, Bombi, Mine Sweeper
* QuickEd (Character set editor for mouse, joystick and touch tablet)
* Digi-Studio (digitized sounds/music utility)
* Issues 1-14 of our News-Disk on-disk magazine
* Issues 15-19 of the printed magazine carrying on from the on-disk mag (scans of the original mags)
* Issues 20-26(last issue) of the on-disk magazine carrying on from the printed mags
* News-Disk Yearly Disk 1 (disk to go with the printed mags, includes lots of Quick source code)

3. What does the CD cost?

U.S based users: The CD costs just US$15 when bought on-line using your credit/debit/charge card via the *secure* PayPal, which INCLUDES shipping. You may, if you prefer, pay in cash in US$. However, cash is sent at your own risk and is subject to higher exchange fees. For this reason, the cash price is US$20 which INCLUDES shipping.

U.K based users: The CD costs just £10 including P&P. You may order by cheque.

Users in other countries: The CD costs just UK£10 INCLUDING shipping. Please pay in cash in UK£.

4. How do I order?

Please go to my website at http://www.dgs.clara.net and then click the link to the CD-ROM info/order page. You will find full ordering information, along with extended information on each product on the CD. There are also screen grabs of the PPP software running in the XL-It! PC emulator.

5. How long will it take for my order to arrive?

Delivery times from the UK to the US are about 5-10 days, depending on where you live. Orders are dispatched within 24 hours when ordered on-line. Please be aware of time zone differences. Most orders arrive during the night here, so please take this into account.

6. Special Notes

Please note that due to legal reasons, I am not allowed to sell this CD to anyone living in Germany, Austria, or Switzerland.

The PPP products do not run on the 1200XL. They do run OK in most PC emulators. Digi-Studio does not run on most PC emulators, but does run fine on all Atari XL/XE machines.

The products are offered without support, but are all mature versions and have no known problems.

I fully agree.

> If you killfile a spammer, he still makes a sound when he dumps his load
> every week...

What is that suppose to mean? I put him in my killfile and he no longer
exists. Now I see an increasing number of replies to a post I never see.

> SCSI controllers?

I'm not bidding anything. I have a Blackbox already. If you have one
for sale/trade, let me know what you're asking.

Yes, I have at least 10 Adaptec 4000a/4070 controllers and last year,
I bought a box full of 200-500mb hard drives off Ebay.

Hi

I've dealt with Ben in the past with no problems at all:)

The problem is the postings are the same over and over and over again,
then there's his opinions on various stuff on his web site which isnt
very nice.

I dont mind the posting once a week bit, i used to do it, it's the
posting of the same post with different subject etc.. so you have to
waffle through the same stuff ALL the time.

Ben has been posting for years, but i have noticed more adverts with the
same content as of late, and i've really been off the atari scene for a
while:((((

My complaint is pages like this one:

http://www.aracnet.com/~atari/auctions.htm

which slander auction sellers to boost his own business.

I doubt there's a thing wrong with Ben's company, I've never seen a
single bad trader post ever so all power to him and may he continue to
support the Atari community for many years to come

But

What people may not like is the unintentional spamming, ie 2 or 3
posts in one day saying pretty much the same thing and the
crossposting. If Ben slapped COMM: or ADV: as per Net standards then
people could happily kill file the adverts but keep other posts from
Ben intact.

The only other thing some inc me have queried with Ben is the wording
of the adverts, being ex retail (in the Atari field) I suggested that
having a mild go at Ebay users might offend the odd one or two
potential customers as many people do use Ebay for their retro fixes
but Ben thought otherwise which is his privilege.

Unless I missed something over the years I am sure there's no attack
on Ben as a company and had I still been able to hold onto my hardware
then I would have no problems about buying from him.

This is a news base and is supposed to be spam free, no commercial advertising is allowed. If he were to post a one liner with a link no one would bother him but he continually posts reams of trash that people have to pay to read.

I've had good success with Ben, however after reading his auction page
you do have a valid point. I think he's completely off base.
I've seen a few auctions get out of hand price-wise, but it's not the
sellers fault, it's the end users doing the over bidding.

A more valid reason to turn to auctions as far as I'm concerned are
certain other Atari dealers, who's prices are not based in reality.
They bank on the idea that the end user is ill informed and the item
appears hard to find and they take you for all it's worth. A keyboard
costs well over $100, that is just crazy, you can get an entire used
TT for about $120. An ordinary floppy mech for over $35, what a joke.

Hello!

This is yet another of my occasional visits to CSAS.
Anybody here remember the '80s and '90s? :)

I see UMich is still hosting Atari Archive. I still
haven't figured out why they'll maintain that part
of history, but wouldn't let anyone take it over and
keep it contemporary. Nor do I understand why they'd
never let a volunteer provide HTML coding support to
pretty up the site.

Owell. I just wanted to say HI! Long live Terminator!

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Last-modified: July 15, 2002

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

Howdy James, Guy, folks

> Give Bob Puff a call http://www.nleaudio.com/css/
> he'll fix that Black box.

He fixed mine over the phone. (he told me what to check and it worked. I had hotplugged the BB and the PIA on it didn't like that.)

CU Mathy van Nisselroy

3794. replacement for CO25953 added to site

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-05 13:38:23 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <ailv4g$2nu$1@nets3.rz.RWTH-Aachen.DE>
Source record: 28365

Howdy folks

I added the file(s) you need if you want to use a GAL instead of the CO25953 (gate array that handles the extra memory management tasts in the 130XE) to my site. Please note that you WILL need to use a 74LS95B too (the infamous U35) and that some of the newer 130XE motherboards (as sold in Europe with only 64kB under the names 800XE and 65XE) do not have space reserved on the motherboard for U35 anymore.

Check out my stuff page at:
http://www-users.rwth-aachen.de/mathy.van_nisselroy

3796. Re: Christmas In ...

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-05 14:23:43 UTC
From: llpwhite@cs.com
Message-ID: <20020805102343.02466.00001528@mb-fv.news.cs.com>
Source record: 28367

Every time I get some new spam in the newsgroup, I just update my spam-blocker (Prefrences). That also keeps out the complaints that frequently follow about whatever the pitch is. The only problem is that sometimes you must be fairly creative to avoid blocking "good messages" as well as the unwanted ones. It really works quite well. I won't even see this reply since I've blocked "Christmas in". :-)

Howdy folks

I just added screenshots of Cervi, Multris and Bremmspunkt to my site.
Unfortunately, Bremmspunkt is ATRed, so you'll have to wait untill next week
when I've unATRed it. (or you can check out
http://unconventional.atari.org)

It's on my stuff page.

(this means you add stuff.htm to

3800. Re: Wanted: 256k+ MIO

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-05 16:50:10 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d4eacbd$0$1430$272ea4a1@news.execpc.com>
Source record: 28371

I was looking into the Black Box a little.
If you do get a MIO, the hard drives you used
on the BB won't work, unless you had MIO
compatibility set on the BB. The MIO has no
BB compatiblity setting, and the two don't
access the hard drive the same.
In addition, the BB may have been set up to use
512 byte sectors, again something the MIO can't
do.

Most of those spammers are remote bots that expect to die after they've spewed
but i also refer then to the abuse@ address.

> If you don't like it, you do have options. I personally don't see

That's not the point, there are rules against it. What other rules for this
echo would you not mind breaking?.

3803. Re: Wanted: 256k+ MIO

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-05 19:53:31 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d4ed7b6$0$1421$272ea4a1@news.execpc.com>
Source record: 28373

(replace the SCSI buffer/line driver on the MIO,
to use BB formated hard disks.)
Uhm. I have no idea. I do a little de-soldering and
soldering, but I don't think anyone would tinker too much with a MIO, unless
it isn't working. I know I wouldn't. Just like the Black Box, I'd only
work on it if I knew what I was doing, like Bob Puff told me what to do..
I worked on a friends MIO, it didn't work. It didn't work when I finished
working on it. The friend and me pretty much wish I'd never touched it, as
another friend went in and pretty much reversed what I'd done. Anyway he
got another MIO that works, and the original one probably still doesn't
work.
I looked up prices on MIOs and the BB. Bob Puff may still have some BBs, at
$199 plus some money for the serial and parallel cables and other goodies.
My ICD book lists $249 for the 256K and $469 for the 1 meg.
I'm sure there are more working BBs around than MIOs.
I doubt ICD sold many 1 meg MIOs at the price they were asking. Actually
hard drive setups, be it BB, MIO, or the IDE mods, are sorta esoteric stuff
for the A8, probably very few have done it, fewer still are actually using
one, but probably a lot of A8 fans would like to set up a hard drive. The
SIO2PC is a very good, functional way to have a hard drive for the A8 and
doesn't cost much.

********** Check alt.binaries.comp.atari8bit for the files **********

The 8-bit demo's:

Numen
Pit
Too hard 3

Most demo's need 320Kb, will run in an emulator. The Numen demo will show
how the VECTOR game (Doom clone for 8-bit) will look like....

These are the beste demo's I have ever seen....!

TXG/MNX

While we're on the subject of MIOs.
I sit around thinking about stuff. Someone, a long
time, years ago, said that they were at a storage place where a load of FTe stuff had been stored. I think it was being 'sacked' because of no rent payment.
Now, I wonder where that stuff went and, here's my idea, what if there were MIOs in that stuff? FTe didn't market MIOs, if I recall, they seemed to recommend the Black Box, so I never saw any MIOs for sale from FTe. I checked ICD's website and they have no 8-bit stuff, some ST/TT/Falcon stuff, but no 8-bit stuff.. I bet Mike Hohman got a lot of MIOs, and never sold them. Lance Ringquist and Bob Klass seem to be the last people in contact with Hohman/FTe, maybe they'd know something. (There were a few other hard drive setups for the A8, Supra had one, and I think Bob Klass still has some of those, the ATR8000 allowed a hd out the joystick ports I think.)

Then perhaps you should take it up with the newsgroup owner instead of
airing your grievances with the entire group? You might actually get
something accomplished. Crying to us about it won't do anything.

Just brainstorming...
Iirc, the only thing the "MIO comp. switch" on the BB does is inverting the bytes it reads and writes from/to the harddisk. So
technically, if you replace the SCSI-buffer/linedriver on the MIO by an inverted one (or by a straight if it already was an
inverting one), a MIO can use harddisks previously used on the BB in native mode...

Not?

> In addition, the BB may have been set up to use
> 512 byte sectors, again something the MIO can't
> do.

Okay, if you used 256 bytes sectors on the BB, that is :-))

Don't know, as I've no MIO myself...

> I know I wouldn't. Just like the Black Box, I'd only

I added termination-power and a parity-generator to the SCSI-bus to run SCSI-2 devices, but that's pretty much all of it.

> hard drive setups, be it BB, MIO, or the IDE mods, are sorta esoteric stuff
> for the A8,

Without a black-box, I think I won't be Atari-ing anymore.

> SIO2PC is a very good, functional way to have a hard drive for the A8 and
> doesn't cost much.

For me the SIO-2-PC interface is an easy way to transfer files between the 2 platforms. It's still slow compared to parallel
harddisks, even at "3 * warp-speed". If only the BB could write as fast as it could read it's data on 512 bytes/sector
harddisks...

3815. Re: 720K Disk Timing

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-10 13:29:45 UTC
From: llpwhite@cs.com
Message-ID: <20020810092945.02449.00002773@mb-fv.news.cs.com>
Source record: 28386

Hi all-
Thanks for the several replies.

Long post warning...
I wasn't too clear about what I'm trying to accomplish. My 551's all work fine, but of course, will not format the back side of a 5-1/4" disk And in truth, that's not much of a problem, because I can always format the back side on other drives, or get out my template (cut-up 5-1/4" disk shell) and punch a 2nd hole. But it just "bugs" me to no end that it can't format the back side. So every so often, I start thinking about how to fix this issue.

The Radio Shack IR LED pair that I tried is mounted in a common shell, so I would have to depend on reflecting the IR light back to the receptor. I couldn't get that to work. Actually, I've learned quite a bit thus far by disassembling a 551 far beyond what I'd done before -- trying to get to the original LED's used for timing. Amazingly, the drive still works after I put it back together!

An interesting thing that I found was that the direct drive (spindle) motor has its windings and *very powerful* magnets that are located directly below the disk -- I'd say less than 1/2". So I don't think that using a small magnet and reed switch or Hall-Effect transducer would be a big issue. OTOH, I would think that even stock, I would not want to leave a "good" disk in the mechanism for long periods of time. I don't have any measurements other than I did take my "field-strength meter" (a compass) and the 551 definitely has enough of a field to move the pointer.

The micro-switch idea would be pretty simple to implement, and I might try it, but seems like it might be noisy -- click, click, click with every revolution. And that would be irritating -- especially when the 551 is such a quiet drive.

Any new ideas?

Thanks,
Larry

When's the last time someone asked about Window 3.1? Made me smile anyways.

Seriously, since 3.1 was discountinued in 1995, there wasn't many PC emulators around at that time. As emulators started cranking up the common intel OS supported was DOS since it got the best performance and you could program direct calls to the hardware. So that's your answer since Windows 3.1 is just a flimsy shell over DOS your best bet is too boot up into dos and get the emulators working.

For the atari, try out Atari800 and a few other dos based emus at:

->This is a news base and is supposed to be spam free, no commer-
->cial advertising is allowed. If he were to post a one liner with
->a link no one would bother him but he continually posts reams of
->trash that people have to pay to read.

Oh, pulleeeze! Not this "pay to read" stuff again! In America,
which is a First-World country, nobody's paying per byte anymore
for internet access, much less at 300 baud or whatever. The poster,
who's apparently across the pond in England, might do well to either
upgrade to a "real" ISP, or maybe buy a higher-baud dixie cup-and-
string modem for his 8-bit. (Note: "dixie cup" is a brand of paper
cup, usually 3 or 6 ounces. I'm not gonna explain ounces. Let's
just say it's a small cup.)

As for the issue of advertising, I have no problem with it. With
this being the main Atari 8-bit newsgroup, and with interest in the
8-bits slowly drying up, I feel it's better to keep as much activity
going on this newsgroup as possible. To that end, it's good to have
all 8-bit postings centralized here. There really is no practical
alternative.

You're apparently unaware that the English don't pay a flat rate for
their telephone service - they pay according to the time they use. To
them, spam is literally costing them money every time they download
it. It doesn't matter what ISP they use - if they're on dial-up,
they're stuck.

> As for the issue of advertising, I have no problem with it.

I don't either, when it's done within reason. Bravo Sierra crosses
the line, IMO.

Atari and Caramel Corn:
Something good from the '80s

At least a decade ago, a small company wrote and released a program that would eventually evolve into a popular desktop publishing package for the Atari ST platform. Originally released as Publishing Partner, the program later became known as PageStream.

The original program, or one of its early updates, included some sample documents which demonstrated the program's uses and features. One of those sample documents was a recipe for caramel corn (!) which was not only a supremely tasty treat, it was exceptionally easy to make (no thermometer! no dropping glops of sugary goo into water!) and it was "goof proof". I no longer have the program or the original document file, but to this day I still make the caramel corn treat every year at Christmas.

So that no one need go another Christmas season without this neato treat, I am posting it here for your pleasure.

Enjoy!

Atari Caramel Corn

Utensils:

Large saucepan, cup and spoon measures, long-handled wooden spoon, 2 cookie sheets or cake pans with at least 1" sides, paper grocery bag.

Ingredients:

6 quarts popcorn (1 cup unpopped corn)
1 cup butter
2 cups firmly packed light brown sugar
1/2 cup light corn syrup
1 teaspoon salt
1/2 teaspoon baking soda
1 teaspoon vanilla
spray cooking oil

Pop corn in advance, using as little oil as possible. If you have an air-popper, so much the better. Set aside.

In a large saucepan, stir in brown sugar, corn syrup, salt and butter. Bring to a good rolling boil, stirring constantly. Reduce heat to medium and continue boiling without stirring for 5 minutes.

While mixture is boiling, lightly treat the inside of a paper grocery bag with spray oil. Place popped corn in bag. Treat the two cooking sheets lightly with spray oil.

Remove candy mixture from heat, stir in baking soda and vanilla. (CAUTION: adding vanilla will likely cause some splattering, be very careful!) Make sure the mixture is completely stirred as the soda tends to avoid the lower edges of the pan. Pour mixture over popped corn and mix gently with a wooden spoon.

Roll the top of the paper bag and place in microwave oven, preferably on a microwave-safe surface, NOT on metal rack. Nuke for two minutes, and then stir the popcorn again. (WATCH FOR STEAM WHEN YOU OPEN BAG!) Repeat this procedure twice more, nuking for 1-minute intervals until corn is completely coated. Variant: you may add some redskin peanuts during the last stir, but DO NOT microwave peanuts as they can add an unsavory smokey flavor to the corn.

Pour candied corn equally onto cooking sheets. As the corn cools, continue to stir to prevent clumping. Variant: I've never done this, but you could probably form corn into popcorn balls.

That's it! You've just made yourself a batch of Atari Caramel Corn!

The original Publishing Partner recipe called for using a warm oven instead of a microwave to keep candy hot for stirring/coating the popcorn. It was convoluted and took approximately an hour. The microwave is much faster and easier and makes no noticeable difference in the final product. (You'd have to be a Windoze user to ruin this treat!)

This recipe is certified Y2K compliant!

> it has read and which track it belongs to.

Well, that's not quite correct. Actually the index signal is very
important:

It is needed by the FDC for several commands, eg. for the "format track"
command - this command will start at the first index pulse and end
at the next encountered index pulse. Another use for this signal is
an internal timeout-counter in the FDC: If a sector header is not found
within, lets say, 5 index pulses (=disk rotations), a read/write
operation is aborted and the "record not found" flag is set.

The idea behind this index - signal is to have a common reference so
that the physical sector-layout will be the same for all drives, and
such ensure interoperability between different disk drives.

Even the FDC used in the 1050 (WD2793) needs an index signal. Since
the drive mechanics of the 1050 does not have an index sensors, it
has to be generated by the internal timer of the 6532. Have a look
into the schematics of the 1050 and you will see that the IRQ output
of the 6532 is connected to the index-hole input of the 2793.

Now, what's really causing troubles is that the index signal can
interfere with certain FDC operations:

Usually, the index-signal occurs as kind of a 'start' mark of the track, but never within a sector of a track. Most FDCs rely on this fact and use this signal to abort a running operation if an index signal occurs. You can consider this as kind of error-checking within the FDC: every operation has to be finished 'til the end of the track - otherwise one would overwrite data at the beginning of the track which is not a good idea in general.

And that's the reason why you can't reliably read disks formatted by a 1050 on a PC: since the 1050 doesn't care about the index hole, an index-pulse can occur within a sector...

so long,

Hias

3837. Modem R: device handlers

Have a read and see what Ben has to say about spam:
http://www.aracnet.com/~atari/antispam.htm

News Flash: There are news readers that scan just headers you know. Anoyone downloading the entire messages is asking for it. It's 2002, even an Atari user can find a news reader that scans headers, 20 or so bytes ain't gonna make someone go broke. Also there is the killfile that apparently some are just too lazy to use.

I've been harrased by some moron (Steve) about quoting in the past for the same lame reason... same applies here. Get over it and get a real news reader cause you can't do jack about it.

Hi James,
I didn't follow the original instructions to the letter. I didn't find BEDIT either, although any hex editor will do. I used a program called frhed, or "Free Hex Editor" for Win NT. The main thing is to just modify the string of bytes that are described. I don't know where the offset is in the cart eprom dump... it really depends on the version. Just search for the pattern that is mentioned in the mod. Then re-burn the eprom into a 27C512. Heck, if you want my modified eprom dump, just let me know... I think I still have it around here somewhere....

I sent email on the same day the post came out, requesting the purchase of
7 systems, but have not yet received an email response.

If anybody has a very clean XL or XE for sale, let me know, as I need a
MUX master. Must have functioning PBI and CART ports.

3846. XF551 Upgrades to 3.5

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-12 03:59:13 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3d573380$1_3@nopics.sjc>
Source record: 28417

I noticed that Andreas posted the original XF551 upgrade from AIM magazine. I would like to add the later changes that you might wish to make in addition to the originals. Some of the original changes have been deleted and some values have changed. I do not enable spin-up at $0C1D and $0E25 anymore. I do not enable spin-up on a seek at $057B, $09D1, or $0B15 (the values have changed). The stock Atari XF551 will only switch from DD to SD when it tries to read a new disk. It will NOT switch from SD to DD unless you are reading sectors 1-3. This makes it very difficult to read a sequence of disks that contain both densities. Once you boot a DD disk and then read a SD disk, you have to re-boot to read another DD disk. With the additional code, you can just wait for the drive to get an error (or, you can hit BREAK) and when it re-tires, it will try the other density. Try it - you'll like it! I have done hundreds of disks with this version with no problems at all.

Here are the changes made to a standard XF551 ROM :

ADDR TO

1. $0528 $00 spin-up on FORMAT only.
2. $0680 $50 make 80 tracks.
3. $080F $60 2's compl of max sector.
4. $0811 $FA hi byte of #3.
5. $053D $03 seek to 3ms+spin-up.
6. $057B $1B seek to 3ms.
7. $09D1 $0B seek to 3ms.
8. $0B15 $1B seek to 3ms.
9. $061D $F4 write with precomp.
10. $0621 $F4 write with precomp.
11. $0D0D $A0 write with precomp.

To alter the retry restore (where the drive is trying to re-read a track that gave him an error), add a JMP $E0 (24,E0) at $09AF. AT $9E0 and $9F0, add the patch:

a. $9E0 $09 INPUT A P1
$53,08 AND #08
$C6,F0 JZ $F0 jump if zero
$9A,CF AND P2 #CF
$8A,10 OR P2 #10
$99,E7 AND P1 #E7
$24,B1 JMP $B1
b. $9F0 $8A,30 OR P2 #30
$89,08 OR P1 #08
$99,EF AND P1 #EF
$24,B1 JMP $B1

This will force the alternate density every time you do a retry restore
and thus switch you to DD when you need it. It works on 5 1/4 and 3 1/2 and
is independent of the other changes.

Hi all

I'm looking for 2 ram extensions for atari xl or xe
I've seen that it exists a 1mo extension, it'd be really cool to have
such extension on my Atari

There's a site on the net explaining how to build one, but I'm not
skilled enough

Is there anyone here who can sell me two of them ?
I can pay a good price for them

Please mail me if you think you can sell me what I'm looking for

Cheers

aldn

I'm not English. They would have to tell you why they pay by the
minute, but I doubt it has anything to do with America's hard-won
fight for independence more than two centuries ago.

Mike

<mkohary@earthlink.net> writes
>
>You're apparently unaware that the English don't pay a flat rate for
>their telephone service - they pay according to the time they use. To
>them, spam is literally costing them money every time they download
>it. It doesn't matter what ISP they use - if they're on dial-up,
>they're stuck.

The /British/ can and often do pay a flat rate for internet access, be
it through British Telecom or cable operators. We're not /that/ far
behind, if it weren't for the low population density in outlying areas
and crap penetration of cable, we'd have the same sort of service.

But I agree than Ben's postings are too frequent and too long. Smacks of
desperation.

Richard

Hi all,

I am looking for someone who can offer me a 14,187576 Mhz oscillator to
put in a 130XE computer.

Anyone knowing where I can get one would be great, too!

Thanks, and regards,

Wef

Yep, being a Brit we do get shafted on the dial-up stakes thanks to
the monopoly BT has but thankfully ADSL is becoming more available.

Maybe I should start playing the pipes and marching with my drums..

look here and ask them. They have created a SIMM Extension which is
compatible to conventional ram expansions. Ask them for
building-plans.

3858. A8 vendors... update

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-12 17:06:40 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D57EB20.23536E42@students.uni-mainz.de>
Source record: 28429

Hello Folks,
her is an update of Michael Current`s vendor list. I have made the
following changes:

- Firma Mileng, Berlin, Germany; does not exist anymore!
- Databyte / M.faust Internetservice (Germany): went bankrupt 2000 or
2001
(www.atari-computer.de also does not exist anymore because of this
case!)
- Strange invasion magazine (S.Lausberg, Germany): does not exist
anymore
for quite a long time now!!
- Verlag Thomas Eberle / computer Flohmarkt (Germany): does not exist
any longer
in its original form; T.eberle publishes nowadays only a
paper-magazine
called "Musik-Flohmarkt" (where you can buy/sell LPs, CDs, EPs,
Singles
and such stuff); the magazine Computer flohmarkt appears together with
Go 64! a Commodore 64 magazine...
- Highlander Soft (R.Altmayer, Germany): He is a private person, and he
told me
that he does not want to appear in this list!
- Vogtlander (H.Weidner, Germany): He is also a private person...
- Roland buehler (Germany): Since the regional group of ABBUC called
ARGS
disappeared, he does no longer support the Atari or at least he no
longer
develops or sells his atari items...
- HS Computertechnik (T.Hang, Germany): He is a private person and does
no longer
develop nor sell any atari stuff...
- Hofacker (Germany): They may still have stuff like Atmas 2 and such;
the given
ZIP-code is 8150 Holzkirchen, this is the old (4-digit) zip-code; in
1991
Germany upgraded to 5-digit zip-code, unfortunately I do not know the
new Zip
code of Hofacker... (I do not have a Zipcode-book!)
- Micro Discount: some 3 or 4 weeks ago I had email contact with Derek
Fern and
he told me, that he no longer sells any atari items, allthough he
still has
the copyrights; think he is searching for someone who will "overtake"

all his
stuff and copyrights; anyway, it does not make sense to list him any
longer...

Think thats all so far. sorry for so many negative updates. Maybe one
should erase Marek Tomczyk for all the german entries, since most of
them do no longer exist... -Andreas

updated vendor list follows:

UPDATES SINCE PREVIOUS POSTING
2002.07.17: Darren Schebek updated (new web/email addresses)
2002.07.14: Sijmen Schouten/MyIDE updated
2002.07.14: Christian Groessler/Atari800 for Sega Dreamcast updated
2002.07.14: Petr Stehlik / Atari800 updated
2002.07.14: Satantronic updated
2002.07.07: minor updates to DGS info

2002.06.24: added Thimo Graef (vendor of new software)
2002.06.24: added Olivier Le Bihan (CAS2BAS)
2002.06.24: added Sauron (used software)
2002.06.24: added Individual Computers (Catweasel developer)
2002.06.24: removed Norbert Haley (New Zealand Catweasel vendor)
2002.06.08: conventions section tweaks
2002.06.08: added Artur Burzynski (j131), producer of SIO2PC cables
2002.06.05: added Foundation Two

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance
their postage costs in replying to you. If they are in the same country it's a
simple matter to enclose an SAE (stamped addressed envelope), which is known
in American English as an SASE (self-addressed stamped envelope). It is not
always obvious how to do this for correspondents in another country. One

answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You
can then send the IRC to someone in another country who can cash it in at a
Post Office there for a postage stamp covering the minimum rate for an Airmail
letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not
much more than a couple of sheets of paper. So if you want a reply with more
than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

I think that technically they would be classed as spam because of the
cross posting and the regularity BUT that's merely on a technical
viewpoint.

Personally I'd only ask that Ben put ADV: or COMM: in front of them
which is totally accepted usenet practice. If he does not then I won't
lose sleep as I am happy to see the 8bit still being provided for.

Not so sure of the wording at times tho ;-)

This is to all who have posted questions or sent email......
sorry I've not responded sooner I've been swamped and have not had a chance
to reply to all of you yet.........
gimme some time guyz.......

Q: Do you have a website?
A: Not at this time

Q: How much do you want for the XXXXXXXXX?
A: Make me an offer

Q: Are they NTSC or PAL?
A: They are all NTSC.

Q: Can I get a Qty Discount?
A: No and Maybe.... (I'm not wal-mart) (but I will entertain offers)

Q: Why don't you put the items on E-Bay so I can bid on them?
A: I don't like E-Bay I like dealing one-on-one.

Q: What kind of warranty do you offer?
A: I will guarantee against DOA for 30 Days. and will repair at my
discression.

Q: I will offer you 1.00 per cartridge?
A: NO Enough said....

Q: Why don't you give this stuff away?
A: It all has value to me.

Q: Will you trade?
A: Yes.... for dollars

Please folks just have patience....

BTW: I do have ST Monitors B/W&Color
and a few stock 1050 Drives and US Doublers

I also have a large collection of Equipment IN ORIGINAL BOXES that I want to
sell as a system (coming soon)

Thanks
Ed

Any major electronics supplier such as Digikey, Jameco or JDR will have
them. This is a standard, off-the-shelf part.

You don't offer any Atari 8-bit software on your site, yet you advertise
the site to Atari 8-bit computer users???

You don't even have a section for it.

Please don't waste my time unless you actually have something.

Hehe.. All I got was a pop-up menu telling me to "bookmark" them
(with Ctrl-D ... and that wouldn't do a thing. It's Alt-K in my browser!)
and then a big Error 404 page :)

Too frequent, too long, sometimes misleading and sometimes libelous.
Literally there's no question it's spam, but it would be more easily
tolerated were it not for these faults.

Mike

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Source record: 28445

There's actually one for sale on e-bay as we speak. I was going to get it, but then I came across a home-built cartridge that a guy did that has MAC/65, Action!, Basic XE, and BASIC XL, all in 1 cartridge (uses dip switches to set the cartridge you want).

Anyway, there's an Action! cartridge and a Mac/65 cartridge available on e-bay at this moment.

3875. ROMcode extraction tool for BB needed (software)

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-13 13:07:31 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>

Source record: 28446

Howdy folks

As many of you probably already know, one can find the latest version of the BlackBox ROM (version 2.16) on my BlackBox page. Unfortunately, this is in a form that the Flash routine (for the FlashROM upgrade for the BB) will understand and therefore exists of 30 files of 2kB each.

I'ld like to put this code up on my page as one, ready to burn file. (Bob Puff has given me permission to put this code on my BlackBox page. He himself has trouble accessing his Atari harddrive.)

Does any of you guys or gals have a utility that I can use to read the code from the BB ROM (without taking the ROM from the BB) in such a manner that I will end up one ready to burn file?

Howdy folks

I've been looking at IDE harddrives (I'm starting to like the SIO2IDE interface more and more. Check out http://www.atari.cuprum.com.pl/) and have come up with some questions:

- What's the difference between CHS and LBA mode? (advantages/disadvantages?)
- What's the small 3 pin connector for that most have next to the IDE and power connectors?
- Are Quantum and Seagate still the brands to look for? Are there 'better' and 'worse' brands?
- Is there an easy way to test if a disk is OK? (I've found two shoeboxes of IDE drives at the local recycling show, but haven't bought anythign since I can't test anything yet)

I've played it using Xforner for DOS a bit. Lack of music and the unusual
keyboard layout used for controlling your character made it a short run.

> Q: I will offer you 1.00 per cartridge?
> A: NO Enough said....
>

Well, I guess so :/ . Usually in an instance when someone shoots an offer,
a counter offer is suggested. A buck a cart for some of the commons is not
a bad deal, actually. Do you know which are more rare or not? Do you have
any idea what ballpark figure for any/all of these carts? Or do you know
which are which and have separate prices for each? I hate guessing...

Anyone else hate to 'make offers'?

Seems like Ebay would definately be the fairest/sanest way to unload all
this stuff. People will end up driving you crazy as I can see you are
already starting to crack.

Good luck,
buckler

Hi Mathy,

The best thing to do is to disassemble each 2Kb block, because the ROM does bank switching and the routines are writen so that each routine is inside 1 block.

This FlashOS program reads out the blocks and write them into Flash so you also know, or this program knows how the 2Kb blocks needs to be linked to have the complete ROM again.

So ask the programmer of FlashOS program if he can tell you if on which address block 0,1,2 etc is 'burned' in to the Flash and then you have all info needed.

I would like to help you out with the dissassembly.

You can use DIS6502 on PC and make a special EQUATES file for the known addresses from the Black-box manual and the you also know the Base addresses of the PIA, VIA and ACIA so this info can be added and you will have a more readable code. With this program you can easy make text fields and more and output it in MAC/65 code.

> (advantages/disadvantages?)

CHS = Cylinder, Head, Sectors
LBA = Logical Block Addressing

LBA is used these days because most software on PC had a 1024 cylinder, 16
head and xx sector limit which could not be expanded in the CHS mode.
LBA translates block as an address so it works like a lineair memory for
0-xxxxxxx the drive translates this automaticly for you to the right
cylinder/head/sector.

> - What's the small 3 pin connector for that most have next to the IDE and

These days I like Maxtor but also Seagate and WDC is ok.
The quality of the drives today is much better so there are only good and
very good drives around.

3886. Atari 8-bit PC CD-ROM of PPP/DGS Products (Quick, SAM, etc.)

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-13 18:07:37 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1029262185.11386.0@iris.uk.clara.net>
Source record: 28307

1. What is the Atari 8-bit PPP/DGS PC CD-ROM?

I have created a PC CD-ROM containing commercial (NOT PD) Atari 8-bit software published by Power Per Post (PPP) and Dean Garraghty Software (DGS). The CD contains the software in both DCM and ATR formats. When the DCM files are transferred to the Atari (by various suitable methods) they will convert back into bootable Atari disks by use of Disk Communicator 3 or above (a freely available Atari 8-bit PD product). The ATR files are for use with PC Atari 8-bit emulators (such as XL-It!), some of which are free and available on the Internet. Each product is supplied with a full manual in PDF format. The Adobe Acrobat Reader (a free product) is required to read/print these.

2. What does the CD contain?

The CD contains the following products:

* Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
* Quick Support Disks 1 and 2
* SAM (Screen Aided Management) V1.25i (80-col desktop system, similar to GEM - no additional hardware needed)
* SAM Budget (spreadsheet)
* SAM Designer (DTP/designer package with circuit diagram creation facilities)
* SAM Utility Extensions (conversion between SAM and non-SAM formats)
* 4 Power Per Post games: Rubber Ball, Glaggs It!, Bombi, Mine Sweeper
* QuickEd (Character set editor for mouse, joystick and touch tablet)
* Digi-Studio (digitized sounds/music utility)
* Issues 1-14 of our News-Disk on-disk magazine
* Issues 15-19 of the printed magazine carrying on from the on-disk mag (scans of the original mags)
* Issues 20-26(last issue) of the on-disk magazine carrying on from the printed mags
* News-Disk Yearly Disk 1 (disk to go with the printed mags, includes lots of Quick source code)

3. What does the CD cost?

U.S based users: The CD costs just US$15 when bought on-line using your credit/debit/charge card via the *secure* PayPal, which INCLUDES shipping. You may, if you prefer, pay in cash in US$. However, cash is sent at your own risk and is subject to higher exchange fees. For this reason, the cash price is US$20 which INCLUDES shipping. You can, if you wish, pay in cash in UK pounds. The price is £10 (including shipping). It may well be cheaper at

your bank to get £10 in cash.

U.K based users: Please pay using PayPal if possible. Otherwise, the CD costs just £10 including P&P. You may order by cheque.

Users in other countries: Please pay using PayPal if possible. Otherwise, the CD costs just UK£10 INCLUDING shipping. Please pay in cash in UK£.

4. Can I see the stuff working first?

You can download old fully functional German versions of Quick and SAM from the CD-ROM info page on our website (address below).

5. How do I order?

Please go to my website at http://www.dgs.clara.net and then click the link to the CD-ROM info/order page. You will find full ordering information, along with extended information on each product on the CD. There are also screen grabs of the PPP software running in the XL-It! PC emulator.

6. How long will it take for my order to arrive?

Delivery times from the UK to the US are about 5-10 days, depending on where you live. Orders are dispatched within 24 hours when ordered on-line. Please be aware of time zone differences. Most orders arrive during the night here, so please take this into account. Orders to UK addresses are sent first class mail.

7. Special Notes

Please note that due to legal reasons, I am not allowed to sell this CD to anyone living in Germany, Austria, or Switzerland.

The PPP products do not run on the 1200XL. They do run OK in most PC emulators. Digi-Studio does not run on most PC emulators, but does run fine on all Atari XL/XE machines.

The products are offered without support, but are all mature versions and have no known problems.

What about Ultima IV? Since it used 4 disks it seems to be quite a
challenge. I can get the emulator to recognize disks 1 and 2 (Program
and Britania), but anytime I try to enter a town, it seems to hang up
instead of prompting me to insert the towne disk.

I would say that the best way to approach it would be to key a pulse generator when the motor is turned on. Make a short index pulse at a 200ms rate - that would look like an index to the controller although it would have no relationship to the actual disk in the drive (you probably could format a piece of paper between the heads, actually). You could do it with just a 555 timer IC, I expect.

You cannot access more than a 4GB drive (or, is it 8GB??) in CHS mode. If you get bigger than that, you must use LBA mode. LBA mode requires a 16 bit interface to implement (which is why I'm working on a 16 bit version - so I can use my 80GB drives...). CHS works with 8 bits.

There are Master/Slave/Cable Select pins on many drives.

Seagate makes drives with 1.2million hour MTBF - I vote for them!!!

There is no way to test a drive. A common failure is to scramble your data every 60 days or so.... You want to run a test for 60 days? The tests that are available will tell you if a drive is bad, but no way to tell if it is good. If it is important, buy a new drive every 3 years. If it isn't, cross your fingers.

What attracts you to the SIO2IDE interface?

Bob

3892. Power for 256k MIO

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-14 01:53:26 UTC
From: James King <utah_lanman@yahooo.com>
Message-ID: <ajcd6m$94h$1@terabinaries.xmission.com>
Source record: 28313

I was fortunate enough to have been given a 256k MIO, but it does not have a power supply. Upon reading many posts in CSA8 from years back, it wasnt clear if 9vac or 9vdc was required.. but I used a standard 1050 9vac 31va power supply, the MIO light came on, but I coudnt access it from my 130XE.

I tried RESET/SELECT, but only got the Internal self test on the XE.

The XE is currently in use with a BB, so I know the XE is good.

Any advice/suggestions appreciated.

3893. MYIDE Interface

Newsgroup: comp.sys.atari.8bit

Source record: 28314

Soon, I hope to be an owner of a MYIDE interface.. question, though - does anybody know if I'll be able to run a Syquest IDE ES135 removable drive? I use the SCSI version on my BB now.

Hi Nir, has anyone tried copying that disk with the 1050 US Duplicator mod?

I still have the US Duplicator in my Quad 1050 which does enhanced density
130k protected backups, but i have no US Duplicator disks now, as i sent
them to you with the manuals a while back, i would be willing to have a go
if you still have the 1050 Duplicator V2.5 disk, an atr image or diskcomm32
file of the disk would be ok, along with the disk in question that so far
cant be copied!

Send me an email for my full postal address

The power supply is ok, I'm almost positive.
I've heard the ps can be either a/c or d/c, 9 V.
As for the self test, I can't figure why. I'd try
another computer. SELECT\RESET should give
you the MIO menu. It won't of course if you're using
a non-PBI OS, say, like Omnimon.

3901. 1050 switch to disable write protect

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-14 07:12:22 UTC
From: Andy Grey <adgrey@comcast.net>
Message-ID: <qpn69.236416$nm.9906504@bin5.nnrp.aus1.giganews.com>
Source record: 28320

I remember seeing an article somewhere about adding a switch to disable the write protect feature of the 1050 drive - avoiding having to notch the opposite side of a disk in order to use it. I remember doing it years ago. Anybody have any info on where I might find this?

Andy

> Well, that's not quite correct. Actually the index signal is very
> important:

Not for the Atari drives, at least, as you pointed out correctly. (-; They
don't use it. Neither it is for other drive firmware (i.e. the Amiga doesn't
use Index sync as well). I'm not sure for the PC as I don't know its
hardware/firmware good enough.

Fact is, there's nothing to care about the index sync sensor because
there is none. (-;

> It is needed by the FDC for several commands, eg. for the "format track"

> The idea behind this index - signal is to have a common reference so
> that the physical sector-layout will be the same for all drives, and
> such ensure interoperability between different disk drives.

I doubt that this really applies. I'd say that the interoperability is
rather guaranteed by having a PLL that syncs on the FM/MFM encoded data
on the drive and hence is able to compensate for differences in the
drive rotation rate within some suitable tolerance.

> Even the FDC used in the 1050 (WD2793) needs an index signal. Since

Hmm - just because I got curious now: Where do I find the schematics
of the 1050, BTW?

> Now, what's really causing troubles is that the index signal can

Sounds pretty reasonable, but a simple time-controlled loop could
do the same - actually, it *does* do the same in the 1050 as I
know now.

> And that's the reason why you can't reliably read disks formatted
> by a 1050 on a PC: since the 1050 doesn't care about the

<nitpicking>
That's only true for the 1050 and 810. The XF551 uses the hardware
index sensor.
</nitpicking>

> Hmm - just because I got curious now: Where do I find the schematics
> of the 1050, BTW?

I've got the "1050 service manual" from the ABBUC Bauplanservice.
But, unfortunately, the schematics are of quite poor quality
(i.e. very small and quite bad copies).

If someone knows an online source where I could download a better
copy I'd very appreciate to know about it!

> Sounds pretty reasonable, but a simple time-controlled loop could
> do the same - actually, it *does* do the same in the 1050 as I
> know now.

Yes, but this method basically has two important drawbacks:

* It's sensitive to varying rotation speeds.

* It's incompatible to uPD765 (and compatible) FDCs, since an
index pule can occur within a sector.

IMHO the 1050 is a good example for "how not to design a floppy drive".
A non-standard, belt driven mechanics (I had to replace the belt
of one of my 1050s some time ago since it was completely worn out),
non-standard rotation speed, crippeled "double density", ...

so long,

Hias

Most of the removable drives use the ATAPI protocol, which requires a 16 bit interface, The SyQuest does not and should work just fine as a standard IDE drive. At least it did on mine.

80GB??

Yes - actually, I don't have much use for 80GB either (lets see..... from my 1050 at 1KB per second... 80 million seconds.... not counting swapping disks.... ummm, 22,222 hours.... ahhh, 31 months.... almost three years just to load it!

But, if you want to use a new HDD instead of some old clunker, you will only find the really big ones for sale. And, if you want to explore CDROMs and such, you need 16 bits. My favorite is the LS-120 drive since it will read floppies and removable HDD media.

Although the 80GB drives still work in CHS mode.... at 2.1GB or so.

The Compact Flash cards are getting really cheap. Like $30 for 16MB. We could use them probably. Even 128MB is only $70. There are lots of possibilities.

3907. Re: 720K Disk Timing

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-14 15:55:56 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3d5a7e79$1_2@nopics.sjc>
Source record: 28328

In defense of the 1050, at the time it was designed, all drives used belt drive - the pancake motor was not yet in use. The mechanism is a standard mechanical assembly from Tandon - it is just without electronics. The 1050 density allows you to write higher density tracks without using 256 byte sectors. Once you increase your sector size, you need larger buffers in DOS - which cuts down on available memory. As it is, DOS 2.0 can still use the first 720 sectors on an ED disk.

3908. Desolderer

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-14 16:41:16 UTC
From: llpwhite@cs.com
Message-ID: <20020814124116.20267.00000219@mb-ms.news.cs.com>
Source record: 28329

I am considering buying a desoldering machine. I have used a "plunger" type vacuuming iron that has worked so-so for quite a few years. I've tried other devices, and the results have been disappointing. I'm tired of not being able to get the solder out of holes and lifting traces. :-(

I would suspect that a few of our group has had some experience with one of these. Do they do a good job? Are they relatively easy to maintain? I would probably use it 3-4 times a year doing upgrades and repairs.

Thanks,
Larry

3910. 65XE and Joystick port output

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-14 17:35:01 UTC
From: sam_5_5_5_0@yahoo.com
Message-ID: <afd7bec5.0208140935.3cbc965@posting.google.com>
Source record: 28331

I am interested in using the joystick ports on my 65XE to drive some external electronics. However, I cannot find the what the limit on current coming in/out of these ports is (most importantly, the four ports that are used for the joystick).

Any help would be apprceated.

(Anyone else hate to 'make offers'?)
I guess I wouldn't mind making an offer.
Most of this stuff is, well, close to being maybe worth
the shipping, so it depends a great deal on where
the seller is located, from California to New York
would be different from Indiana to Ohio. I'm sure
the seller wishes to maximize his return, which is
natural. Jim King's offer to buy 7 computers would
cost plenty shipping and packaging. I know I feel
I don't want to sell much or anything over the internet
as lots of potential problems successfully completing
a deal (seller slow in sending, seller's requirements
for payments, buyer payment, what happens if there's
a problem with it when it arrives (even with a 30 day
exchange/repair) and finally a great big hassle packing
and shipping (a SC1224 Monitor would probably cost
$30 just to ship it, assuming you had a box.)
I dunno, the stuff is interesting, if the seller lived near
me, I'd like to just go pay cash and pick it up myself.

They are standard 6520 PIA ports<Port A I think>. IIRC Atari added
additional series resistors and some other stuff maybe to reduce RFI.

The 6520 port just has a passive pullup resistor on chip that ties to the +5
V. With the protection circuitry you will be lucky to get .3 mamp. They will
sink a lot more current, but then the protection circuitry has something
like 220-880 Ohm resistance so you will never be able to sink more then a
mamp or three.

They will drive CMOS directly and if you either use a transistors like
3906/3904 with a hfe of 40 or greater you can drive a small relay.

I seem to recall Radio Shack had a photo triac that could be used to switch
a 110V ~7 amp triac.

You've probably figured it out by now.
An Omnimon you're not using, as you use a BB with
this computer. Just a few points.
The green power light coming on is good.
You turn the MIO on before the computer.
When you turn the computer on, the red LED should
blink for a second, this indicates the MIO and computer
are connected and talking. If it doesn't, there's a problem.
Interested in how it is going.
Actually you can damage the MIO and/or the computer
if you power on the computer with the MIO connected but not turned on, the
MIO then draws power from
the computer.

Source record: 28335

If the MIO still isn't working right, the first thing
I wold suspect is the flat ribbon cable from MIO
to PBI. It gets stretched/pulled a lot because it
is short. A continuity check from the pins inside to the
block connector might disclose a open wire. It is
the only successful fix I've ever done on a MIO,
replacing that ribbon. The power to the MIO is
probably good, as the green light comes on, so
the bridge rectifier with four diodes is probably good.

I don't remember what the values are, but there used to be commercial
kits that did all kinds of things driven from the Joystick ports. A friend
of mine
had a thermometer hooked up to his hanging outside his window, so that you
could see the outside temperature from his BBS.

lol!
Just think after loading it up the drive was a bad one and dies! (horror!)
After I posted the message, I was thinking on what your plans where to
format it? Ok you might get away with the low level format but not the high
level partition format and information. I once did a 1 gig scsi on the
blackbox about 8 years ago and it took forever just to high level the many
many partitions .

I can recommend the $100 Xytronic One Shot Desoldering gun from Jameco,
more than enough for the hobbiest without mortgaging your first born.
And with a little upkeep will keep on performing for years. I use a
pin vise type drill bit set for welding outfits to keep the orfice(s)
clear and able to breath. But you will still have to watch out for
those darn XE motherboards - they still want to lift a trace sometimes
unless the chip will fall out on its own that is. And with this gun,
that has happened to me (falling out), but not often enough.

I've got the 'deluxe' switch that came with my Happy upgrade. It has a three position with a lamp to indicate write enabled. Honestly I believe it would be as simple as cutting the traces to the little switch inside and soldering leads to a two position switch mounted in the faceplate. It should be very obvious which switch inside to bypass.

Since I'm an audio repairer I have two at work, a very expensive one (Weller), and a bit cheaper one (Hako). Well, I can say those
things indeed suck :-) I rarely use it anymore since you can desolder only a few pins before it's stuck again with trash and then
you'll have to take it apart to clean it again. Too time-consuming, so I use an old fashioned mechanic one with a spring.

> Do they do a good job? Are they relatively easy to maintain? I would

In my opinion it's a bad investment for only a few desoldering-jobs a year. A small mechanic one will do also...

> What attracts you to the SIO2IDE interface?

Don't know what attracts him, but I ordered one to make it possible to use the same harddisk on both my 130XE's, simultaneously.
Since it's connected to the SIO-bus I can plug it after my SIO-splitter interface to share the device on both computers (as I do
with some diskdrives also). This makes it easy to use the same data on 2 computers, like, 1 for coding and assembling, the other
to run the assembled executable. As a bonus it will also work with my black-box', so I can exchange data between my blackbox' when
using the SIO2IDE as a buffer-drive...

Here are a few questions I have, since I've never really understood this issue properly...
1) PAL Carts don't work on North American machines?
2) All carts are either PAL or NTSC?
3) Disk based software is fine? If so why is this?
4) What is Australia's standard (there are a few things on ebay from Australia I wouldn't mind bidding on)
5) If your using the monitor out, instead of RF does the difference still apply?

In what form? How would you use these cards? The reason I ask is that you could plug them in your cartridge port - but then what? You read a bunch of data into memory? And...? The only thing I can think to use them for is to load a battery-backed up ramdisk. You could dump 512K into your machine pretty fast. Or, you could dump your HDD files to CF backup thru the cartridge port. Other than that - what?

Nice thing about IDE is that you don't do ANY kind of format - just read and write.

I've done a storage device using a compact flash card and a Mitsubishi M38049 chip for work. I was thinking of making an Atari compatable SIO drive using the cards. The only thing holding me back was finding out if there was interest in me making them... Maybe selling them complete for $25-30 dollars, without a CF card.

If anyone would be interested in buying one, email me and maybe I'll go ahead.

here are some info

1) Yes ATARI 800/XL/XE Pal cartridges games will not work properly on
NTSC machines
2) all atari official cartridge release will work on PAL & NTSC
Ataries.. there are some unofficial / home made Pal carts from
germany/poland etc.. that will not work on un-modified ntsc computers
3) same on disk based software.. dues to timing / scan line differens
some games developed on PAL counters (europe etc..) will not work
properly on NTSC machines (music will be faster, screen flicker and
even game crashes)
4) Australia standard is PAL
5) using monitor out will not solve the problem.. you need to replace
your ANTIC chip with PAL antic chip and use a Multy system monitor or
tv. .then you run all PAL games on NTSC atari computer

The CF interface is IDE - they would probably work on the SIO2IDE circuit that exists today. How about a SIO2IDE built on a 6502 chip? You know, the 850 is a 6502 (6507) on the SIO.... you could use that. Then folks could mess with it!

Why would it need to be battery backed ? My CF cards in my iPaq PDA and
Digital camera don't loose their data when you eject them.

If you got the reader interface right could you not just use it like a hard
disk partiton ? You could have a reader and as many 16Mb cards as you liked
(16Mb card costs about 15 / 20 UK).

Cheaper and much less prone to damage than floppies or a black box HDD
combo.

By the way I'm no electronics expert - just a hobyist so I could be talking
hot air and this could be impossible.

Just me two penneth ...

The 6502 is synchronised with the line-scan rate of the display, so
the PAL machines run at at about 2.1 mhz while the NTSC ones run at
1.8 mhz.

Since the display occupies the same number of scan lines, the chief
effect is that there are more clock cycles available in the vertical
blank period on a PAL machine (more blanked lines, slower frame rate,
faster clock speed). Thus it is possible to write a vertical blank
interrupt routine that has time to run on a PAL machine but not on a
NTSC one. I don't know if anybody has actually done so.

Apart from that there is no reason why a program in any form,
cartridge or disc, should not run on both standards.

Though I've not tried desoldering on an Atari motherboard, I've had
pretty reasonable success with the red rubber bulb solder sucker.
Radio Shack sells them- the nozzle tends to clog pretty fast, but a
teeny screwdriver is good enough to poke the solder into the bulb, so
it only takes a moment to clean. The bulb slurps a good bit of air,
so it can grab a big pool of solder or move enough air thru a hole to
clear it. Probably not as good as an expensive solder sucker, but
they are pretty cheap- and would make a good cat toy if nothing else.

3943. SIO Cart reader

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-16 02:26:03 UTC
From: Andy Grey <adgrey@comcast.net>
Message-ID: <%oZ69.16866$m91.1015302@bin5.nnrp.aus1.giganews.com>
Source record: 28263

Hello to anybody who might be interested and could help. I have, in the past built a few differnt 6502 based devices consisting of 6502, various amounts of static RAM, 8k EPROM (programmed with Larry Woodgeard's eprom eprom burner that plugs into the joystick ports) LCD displays, and 6821 I/O chips. One of the projects was a printer interface that converts that screwy Atari serial protocol to centronics parallel. I'm sure there are better, simpler, easier ways of doing it - but just for the fun of it I intend to build a 6502 based device that sits on the SIO bus. The device will have 32k of RAM and a female cartridge slot and will read cartridges to its on-board memory. It will then transfer the dump to the computer via the SIO bus. I'll put an LCD in it just for status messages. I've been visiting various atari related sites people have put tohether, reading reference material like Mapping the Atari, Computer System Reference Guide, etc. to bone up on cartridges. I wonder if anyone can answer a few questions to help me out:

1) Does anyone have any female 15 position SIO jacks for sale?
2) Does anyone have the female cartridge connector that's in all the computers complete with the plastic piece that pushes the cartridge cover back I could buy?
3) I assume that, assuming I can make it work, have transferred a cart to memory, I will then need a dummy cart for the computer to make it think there's a cart installed and the software is not actually being run from RAM. How do present cart dumping, running software take care of the possibility that the cart software will try to write a number to a cart location and if it can change it, and if it can, then refuse to run because the area must be RAM? Once a cart has been dumped does the software have to be disassembled, and then cracked to remove the RAM/ROM check?

Any information or assistance anyone could render would be appreciated.

Andy

Hi Larry

After working (and getting college education in) electronics the way I find easiest for myself is a fine point soldering iron and good desoldring wick with a small bottle of liquid flux. When doing repairs at work (in a previous jobs) a microscope (with built in lamp) made the job easier on some of the fine pitch components. Another idea is to find an electronics surplus store and find a busted board from some old device (it dont really matter what it is) to practice on before working on your 8bit.

I found an article with this mod reprinted in Z-Mag #190. The Z-Mags are archived in several places, but if anyone needs the article, let me know and I'll be happy to email it. This is not a difficult mod, and I have added it successfully to two 1050's.

There is also a mod to add a switch to change the drive number in Z-Mag #128. Perhaps not quite as useful, but still quite handy at times.

Larry

Yes - the CF cards retain their data without batteries. I was thinking of loading from the CF card to an internal ramdisk in the computer that is battery - backed.

You could use the CF as a normal hard drive, but that takes an internal or PBI upgrade. If you do that, you could just use a real HDD and/or an LS-120 (for removable media storage). The cartridge idea is cool because it would work on any machine with no modifications - even a stock 400 (you would have to bypass the cartridge cover interlock).

One nice thing about CF storage is that it draws very little current and can be powered by the host machine.

Thanks for your input - we bounce this around and something really great may pop out!

Howdy folks

Since I told Google where to find my site, traffic seems to have increased enormously. Anybody know how/if I can check if this is:

- Google checking for changes
- Idiots looking for email addresses
- Atari users interested in my site
- Next of kin, who are entering their own last name in search engines
- People that are looking for whatever on the net that are accidently guided to my site. (like they wanna know more about blackboxes used on aeroplanes and pointed to my BlackBox page.)

(I can use a Guestbook, but since I never sign one on other peoples site......)

Howdy Bob

> What attracts you to the SIO2IDE interface?

The fact that it uses the SIO bus. Which means I can use it on all my computers, even the XEGS. And with the Automatic 2 computer Interface (check out my site to learn more about that one http://www-users.rwth-aachen.de/mathy.van_nisselroy click on 'some stuff I collected' and scroll down almost to the bottom.) I can use it on 2 computers at once.

I think Jindroush is the resident expert on cart dumping. You probably should check out his site. He has close to 400 cart dumps so far. He made a pass-thru cart (like the R-Time8), and some software that pretty much will dump anything:

Atari Cartridge Dumping Project:
http://www2.asw.cz/~kubecj/acartdp.htm

dumping device:
http://www2.asw.cz/~kubecj/data/acarts/hackopen.jpg

Well,
didn`t IBM produce harddisks that are small like "matchlights" or
matchlight boxes ?!? Are these IDE or SCSI harddisks ?!? Think they are
available in megabytes and a few gigabytes (a)300-800 MB and b) 1 or 2
GB). Just what one needs for the small atari: a small harddisk with less
than 2 GB. But I am not sure if these harddisks will work with any of
the Atari harddisk interfaces floating around... -Andreas.

P.S. Bob, why not try a standard tape recorder instead (600 Baud) ?!?
hahaha...

Can the ground and +5 drive a chip directly, or should I connect it to
the external power supply (as the end result will be driving relays,
there will be an external power supply.)

> and pointed to my BlackBox page.)

Technically, that's quite easy: just analyze the logs of the webserver.
More precisely: look at the referrer URL.

For example:
AAA.BBB.CCC.DDD - - [14/Aug/2002:10:18:00 +0200] "GET /~hias/atari/ HTTP/1.0" 200 3468
"http://www.abbuc.de/cgi4/index.html" "Mozilla/4.0 (compatible; MSIE 5.5; Windows 95)"

-> this tells me someone reached my page from the ABBUC page.

AAA.BBB.CCC.DDD - - [13/Aug/2002:17:05:29 +0200] "GET /~hias/atari/ HTTP/1.0" 200 3468
"http://www.google.com.pl/search?q=writeatr&ie=UTF-8&oe=UTF-8&hl=pl" "Mozilla/4.0
(compatible; MSIE 5.5; Windows 98; Win 9x 4.90)"

-> Someone reached my webpage when searching for "writeatr" with google.

BTW: I replaced the originating IP-addresses with AAA.BBB.CCC.DDD

If you want to learn more about how to analyze logfiles, just search
the web, there are lots of fine documents about this topic.

Your main problem will be how to get the log file. Unless you are
running the webserver by yourself, you'll have to contact your
ISP or webhoster. Their polices vary widely. Some will allow you
to download the full (access- and error-) logs, some won't give
you any access at all...

so long & good luck,

Hias

3959. Re: 1050 switch to disable write protect

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-16 22:41:13 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <dcf79.6639$LO1.559678@newsread2.prod.itd.earthlink.net>
Source record: 28280

Andy;
I opened my 1050 (invert, remove 4 screws on bottom plus 2 in front bezel, upright, lift rear of case top half and jiggle forward such that bezel separates from bottom half and remains with top) to reveal the write protect mod from about 1985.

All connections are made to the front one of 5 connectors along the left rear of circuit board marked J11. I cannot see the screen printing on my board, but a schematic found online indicates pin 1 of J11 is to the rear. All of the wires from J11 are white resulting in some slight uncertainty concerning the two connections to RB and LT. Logic and wire lengths seem to indicate they should be as depicted, but anything is possible and LT - RB could be easily reversed to achieve functionality.

Components are an LED (mine blinks red) and a double pole mini switch with three positions and center off. Is that a triple throw DPTT? Connections were made with 20-24 gage wire and some shrink tubing; allow about 30cm for each of six main leads.

The LED is mounted near upper left corner of front bezel with the switch below it centered on the left side of the bezel where the clearance is maximum, the body is about 13x13x13mm plus the terminals and the toggle. The layout is as follows and this may render slightly better in a mono spaced font such as Notepad:

The key is Left, Right, Top, Center and Bottom.
```
--------
LT | o o | RT
LC | o o | RC
LB | o o | RB
--------
```

Add a lead to J11 rear pin 1 maintaining current connection and join this lead to the LED long lead. Break the connection to J11 2nd from rear pin 2. Connect pin 2 to the RC right center terminal and the wire cut from pin 2 to RB right bottom terminal.

Add a lead to J11 2nd from front pin 3 maintaining current circuit and join it to LB left bottom treminal. Break the connections to J11 front pin 4 and connect pin 4 to LC left center terminal; connect the wire cut from pin 4 to LT left top terminal.

Finaally join the LED short lead to TR top right terminal, double check connections and reassemble. I used a twist tie in the upper left vent holes to hold leads and preclude pinching by screw stands and internal mechanisms during assembly and then slipped it out gently.

This mod presents three settings for your convenience and peace of mind.
Centered is PROTECT mode where you cannot write to any disk even if it is
notched. Down is the standard NORMAL mode for writing to notched media only.
Up is the new UNIVERSAL WRITE mode for writing to the back of a disk or to
media with a tab covering the write-protect notch. The LED warns you of the
dangers of this setting!

Hope this was what you wanted; if I can locate that original article, it
will go up on my site. Btw, I thought early Analog had an 810 mod which
might be similar and could explain circuitry enough to verify the pin 2 and
pin 4 uncertainty, but I did not locate it; perhaps it was Compute!...

Yes, I think you mean the IBM Microdrive. You can find some more
information at the IBM webpage: http://www.storage.ibm.com/hdd/micro/

> Are these IDE or SCSI harddisks ?!?

They are IDE, and usually come as compact flash (CF) cards. A CF
card is basically an IDE device, just with a smaller connector.
So if you are crazy enough, you could even solder the wires of an
IDE cable directly to the CF card - I wouldn't recommend it, but
it is possible :-)

> Think they are
> available in megabytes and a few gigabytes (a)300-800 MB and b) 1 or 2
> GB).

I haven't seen the 2GB drive yet (although IIRC it was announced some
time ago). The 1GB drive currently costs approx. 300-400 EUR.
Not too cheap for a harddrive, but IMHO affordable if you really
want a small storage device.

> Just what one needs for the small atari: a small harddisk with less
> than 2 GB.

If you really need a small device, and price doesn't matter: ACK

Otherwise: you can get an old 1GB 2.5" harddrive for (almost) free
- eg. from an old, broken laptop. Even new 2.5" drives are far
cheaper than the microdrive (10GB cost ~100-120 EUR).

so long,

Hias

Source record: 28285

You wouldn't want to solder to your CF card - they make little adaptors that do the job - costs about $20 at SiliconKit.com.

I got one and plugged the CF card into my 1200XL - worked great! Reads about 125 sectors per second. Writing is a little tougher since the CF controller has to execute a routine to replace the array data. If you string together too many writes, you have to wait a bit. I haven't figured out how many sectors you can write, but it is more than you'll do on your Atari unless you're sector copying another HDD.

A 64MB CF card costs about $30...

The difference is that with this selector switch, you can flip the switch (presumably installed on the front of the drive) if/when you need to change the drive number. It is just a matter of increased convenience.

Excellent, Ron, thanks. The switch would be a double pole, double throw
(DPDT) and if it had three postitions with center off then CO is one
way of putting that or on-off-on is another.

HTTP Referrer information is captured by most webservers, so you can
see what the last page they were on before they hit your site.

With search engines, this often includes info. about what they were
searching for.

e.g., if they go to:

www.some_search_engine.com

and type in "atari" and search, they may end up at the results page:

www.some_search_enginge.com/search.cgi?keywords=ATARI

and if they go to your website from the result page, that URL will be
in the 'HTTP referer' part of their request.

Say the page on your site they hit was: www.mathy.org/atari_stuff/junk/,
the entry in your weblogs would include both:

/atari_stuff/junk/ [the page that was accessed], and:
www.some_search_enginge.com/search.cgi?keywords=ATARI

... the referring page. (It'll also include extra junk like their IP
address or domain, what browser & version they were using, etc.)

Many web log analyzers do all the hard work for you, and can actually
show you a list of what search engine keywords were used to hit your
site (to the best of the analyzer's knowledge...):

Google: atari 123 hits
nisselroy 46 hits

Yahoo: atari 41 hits
nisselroy 74 hits
blackbox 5 hits

...and so forth.

Good luck!

And some have web analysis done for you already, so you just go to
a special URL, or log in to some HTTPS server and poke around your
account tools.

Argh... That's correct. Actually, I wrote a paragraph about adapters,
but I managed to delete it prior to posting my message. Well, that's
the risk of using vi late in the evening when you are a tired :-)

BTW: I haven't yet looked at the adaptors from SiliconKit.com, but
there are lots of different adaptors available: CF to 2.5" IDE,
CF to 3.5" IDE, small ones (basically just the two connectors),
and larger ones (that'll fit in a 3.5" bay as a direct
replacement for a standard harddisk).

so long,

Hias

I hope I didn't accidentally delete some text again :-)

3974. Atari Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-17 11:53:31 UTC
From: pdavis68@hotmail.com
Message-ID: <8e43b66c.0208170353.50daedc6@posting.google.com>
Source record: 28295

I'm thinking about building a power supply for my ataris.

I have several reasons for wanting to do this. The main idea, though, is to have a single power supply with a number of fairly short cables coming from a single supply. Not quite as messy.

My plan was to do the floppies and the computers.

Basically, I'd power up to 1-130XEs and 2-1050s.

I'd just like to verify that I'm not going to blow anything up.

From the FAQ, it appears that all I need for the 130XEs is 5V @ 1.5A and for the 1050s, I need 9v @ 2A x 2.

Is this correct?

My concern is the power supply for the hard drives. Both drives would be coming off the same source. I actually can't afford to pull 2A off of both drives at once. In fact, even without the computer, I'd be close to the maximum that the transformer can handle with both drives pulling 2A.

My guess is that the Atari supplies carried extra juice just in case.

My transformer is the real bottleneck. I've got a 12.6V @ 3A. Is this going to cut it or am I pushing it too hard?

Thanks.

Pete

Nice interview.
The only thing I miss from having Linux partition on
my PC is 'Koules'. I like those 'negative gravity'
games. There was a good one on the ST called
'Rejection'. These games are sorta like air hockey
in reverse, the objects repel each other instead of
bounce. You tried 'Koules' Bill?

> the external power supply (as the end result will be driving relays,
> there will be an external power supply.)

Yes. The reccomended maximum current you can draw off the +5V line is .2
amps. If you pick some of the micro relays their coil resistance is ~80 Ohms
I think => they draw about 60 mamp each. You could probably draw a lot more
but the problem you will run into is the Atari power supplies themselves
barely supply enough current to run the computer w/o burning up.

The simplist design you could use would be a PNP<3906 type> transistor
driven directly by the port pin. The 220 Ohm resistor that Bob mentioned
will limit base current. You can just wire the collector/emitter in series
with the relay's coil and the coil resistance should limit current through
the transistor to safe levels.

You may get some glitches with voltage spikes from the relay coil crashing
the computer on switching. The solution was simple for me, just switched
which side of the coil the transistor was wired to. Can't remember if it
ended up being on the ground side or 5V side.

You need to be very careful here...

The nice thing about separate supplies is that each unit has a transformer isolated power source. With the devices interconnected, you are wiring them all together at some point - which is OK if you're isolated. It may not be if you're all common on one supply. You could get some serious fireworks under some failure circumstances, or just nasty ground loops.

12.6 volts AC is way too much power for the Atari. The 1050 is on the point of meltdown at 9 volts - 12.6 will kill you.

Yeah, well....

You know, one way to do what you want is to just alter the cartridge selection hardware such that you can control cartridge access. Re-wire the RD4 and RD5 lines from the cartridge itself to PB2 and PB3 on the 6520 PIA chip. Then you can boot with "no cartridge", load your dump software, and turn on the cartridge to access the data. All you really need is to be able to take control at boot time.

I use old, wasted 600XLs for cartridge parts and such. You could use the whole machine in this case.

The 130XE takes 5 V DC and the 1050s need 9 V AC; I am not certain exactly how many amps they pull. I plan on using an old AT power supply for that 5 V DC when the stock one finally goes. I have seen plans on one of the OHAUG disks to build 9 V AC transformers from one side of an 18 V unit; don't know if the Shack still stocks these or not.

How do the analog ports work? As far as I can tell, they measure
resistance from ground to the input. If this is true, it may be
helpfull...

What if I need more than one relay? Should I use more than one
tranistor?
(Don't worry about the Atari powering the relays themselves, I know
for a fact I will need an external power supply.)

No, 12 volts DC will not power a 1050 as it was designed to use a 9 volt
AC power supply. The 1050 utilizes what are called voltage doublers in
its power rectifier circuits that effectively doubles the 9 volts to 18.
But I can't recommend that you use 18 volts DC either - I would leave
well enough alone as far as the disk drive power supplies go.
Ground loops could get very dicey, as Bob pointed out. Atari went to
great measures to avoid that possiblitily by using AC isolated power
supplies for the disk drives, why ruin a good thing?

Changing drives-numbers can be very useful for those who have their 1050's upgraded with a Speedy D / DS mod. This upgrade has a
built-in DOS on EPROM that will boot when no disk is inserted. There are several versions of the Speedy. The standard one has
BiBo-Dos built-in, while the Turbo-Speedy has Turbo-Dos built in. Since you can only boot from "D1:", changing the devicenumber
comes in handy (redirecting the drive in modified o.s' or black-box will not work)

That's a nice idea!

In 1986 the german "Happy Computer" magazine published a special issue
about Atari 8bit computers ("1. Atari Sonderheft") containing a very
interesting project: a cartridge experimenting system.

That was basically a circuit consisting of 16k RAM chips, a cartridge
slot, several TTL ICs and a lot of switches. This circuit was plugged
into the cartridge slot of an Atari and could do almost everything
one wanted at this time:

* it could emulate 8k, 16k, and 16k bankswitched carts
* you could disable/enable the circuit at every time
* you could switch between the circuit's RAM and an plugged-in cart
* you could put the RAM of the circuit into read-only-mode
* etc....

So it was a very nice device if you wanted to create your own carts,
copy carts (dump the cart to file and later load it into the
circuit's RAM) and all that stuff. Back then I used it for several
experiments and it helped me a lot understanding some of the
concepts (eg. "diagnostic" carts vs. "normal" carts).

If you are interested, contact me by email. I could then search for
the article and scan it. But beware, the description is in
german... (at least, the circuit diagram should be obvious)

so long,

Hias

Bob,

I think there's a little misunderstanding. I'm running the 12.6 volts through voltage regulators. Several LM7805s (5V @ 1A) in parallel and several LM7809s (9V @ 1A) in parallel to handle the amperage required.

I'm building in short-circuit and reversed-voltage protection and will have a fuse to handle excessive amperage.

While I expect a bit of heat dissipation because of the voltage difference on the 5V, I've got heatsinks and a fan to minimize the problem.

3993. MyDOS disk layout

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-18 13:09:04 UTC
From: pdavis68@hotmail.com
Message-ID: <8e43b66c.0208180509.34d2c11a@posting.google.com>
Source record: 28214

Does anyone know where I can find documentation on the MyDOS disk formats? Particularly, the higher density formats.

I'm writing a Windows-based ATR editor. I want to have drag and drop from the Explorer and the ability to open multiple ATR files and drag and drop between them as well.

My first concern is with the MyDOS layout, but I'd also like to know the SpartaDOS format for larger disks for later development as well.

I've created a 65535 sector ATR file with MyDOS and found the VTOC begins at sector 651 and the directory at sector 717.

For Atari DOS, the VTOC is at sector 360 and the directory begins at 361.

Thanks for any help anyone can provide.

Pete

3994. Help me diagnose my 800 video problem

Hi,

My Atari 800 appears to require a warm up period before the screen is recognizable. First the screen is severely distorted diagonally, the after 20-30 seconds becomes readable but still fritzed horizontally:

http://www.digitalironworks.com/screen1.jpg

That picture is after the computer has been off for 30 seconds or so and turned back on. It's worse initially but the picture is representative of the type of problem. It eventually settles down into a stable picture.

What is failing on my machine and what can I do about it?

Thanks,

Paul

I belive the 1050's require an AC supply.

For the 1050's, I think you'd be better off putting a couple 9V
transformers in parallel (being careful to get the polarity matched
for both the primary and secondary). Jameco has reasonable units.

You could probably tap off the paralleled transformers for your 7805.
Power supply design is very tricky but it looks deceptively simple.
Be careful...

I had a couple of boards that I used for fooling around. One used two small
relays, a MC3040 triac driver I thought; there is a similar circuit here I
found that uses a 3041 so my memory may be failing
http://www.discolitez.com/images/triaccircuit.gif and I had some simple
thermisters and a light sensors wired to the analog ports.

The most you are going to be able to use off a joystick port is 4 outputs, 2
analog inputs, and a on-off type switch.

For the transistor it will depend on the relay you use. The small signal
transistors that the port can power can't really drive a lot of load. The
alternative is to go with a power darlington with a hfe of
400-1000<guessimate> or one of the VMOS type transistors. I think I used
something like a TIP31 driven directly by a CMOS chip to drive a solenoid on
a digital combination lock I made.

The analog<from your other post> ports just measure time for a capacitor to charge through a resistance to a logic level 1. It is fairly easy to get stuff on scale with them but you may not have the full 7 bits of resolution. Just use a ~100k Ohm trim pot in series with your detector with 5V supplied to it. Even the Radio Shack ~7k thermistors work well for gross measurements.

I fooled around with some other projects I got out of an old Forrest Mimm's<sp?> article in an electronics magazine. Kind of simple, just solder wires to two pennies and place some conductive foam in between them. As the foam gets compressed the conductance increases so you have a 2 strain gauge.

3998. Re: Atari Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-18 19:17:57 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3d5ff3d2_2@nopics.sjc>
Source record: 28221

You have to power the 1050 with AC voltage unless you want to go inside and solder stuff. It takes 9 volts AC, no more.

If you are going to do something like this, try the high current adjustable regulators. I seem to recall T03 devices up to 5 amps. LM323K? I disremember.

You could build a 60HZ square-wave switcher to run the 1050s.... Or, actually, an even higher frequency may work better on the voltage doubler in there. Send in 9 volts peak-to-peak instead of RMS and it will even help the 1050's heat problems.....

You sure you want to do this? I have considered building a multi-port supply using all my old dead (the fuse blows inside them usually) Atari supplies. Just yank out the transformer and mount a bunch of them in a case with fuses and such. But, one transformer per cable....

Hmmm...I can't remember how much of the 800 was socketed..

You might want to try the old 1 inch drop fix..

No, it's real :-)

Some chips get oxidation on the legs and basically don't make contact
and may be unseated in their sockets. Basically you pick up the
machine and drop it from an inch DO NOT GO MAD AND GO HIGHER!!!

That normally reseats any chips..

If you don't feel confident then don't do it but it really IS an old
trade fix :-)

Hi,

I think your 800 has some bad contact problems. I have seen this on several
800 computers.
It also could be the power supply.

Koules was by Jan Hubick. It should be in just about any Linux games
archive. A Google search for it shows it has/had a security problem of some
sort, mostly could give root access with some error or something. I guess
it accesses video hardware such that it has to have root access. As with
all GNU stuff, the source is available, I think. I'm sure I have it on some
of my Linux distribution CDs (you know the 7 CD sets for $19.99), they read
with a PC.

Thanks for the replies and suggestions. I haven't made a final decision yet, but it will either be the Xytronics 968 (console-type) or hand held, based on the info I've found thus far. Incidently, Jameco had the best prices that I found on the web.

4006. A question of personality

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-19 04:08:26 UTC
From: Paul Gifford <paul.gifford@comcast.excise-this.net>
Message-ID: <_a_79.57939$m91.3195758@bin5.nnrp.aus1.giganews.com>
Source record: 28229

In troubleshooting a video problem I replaced the GTIA in my 800 with one from another 800 (problem solved). In doing so I noticed quite a difference in the "personality" board - the one containing the CPU - between the my 800 and the extra I have. The layout of the board from the extra computer didn't match mine...you can see the board in question here:

http://www.digitalironworks.com/per_board.jpg

It also has fewer chips than mine.

Searching around I learned that the 6502 in this board is "Sally" (CO14806), so is a 6502C. My 6502 is CO14377. I read a brief technical description of the difference but what I'm curious about is when the change was introduced to the line. Is my computer (with CO14377) an early 800 or is the computer with CO14806 a late 800? I found conflicting notes on the web so maybe someone here knows the answer.

Thanks,

Paul

4007. XF551 with 6502?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-19 04:09:15 UTC

Message-ID: <20020819000915.09199.00001451@mb-ml.news.cs.com>
Source record: 28230

While doing a Google search on the XF551, I ran across a second reference to the XF551 having a 6502 (in this case 65C02) processor coupled with a 2793 FDC.

The original reference that I saw was a review in Antic -- probably about 1988. I have never seen a 551 with a 6502. But until a couple of years ago, I had never seen a Rana with a 6502 -- and then I got one. So I can't rule it out. Likewise, IIRC, the 2793 does not support double-side operation (2797 does), so unless Atari was prototyping a SS version of the 551, a 2793 wouldn't work. According to the info released, the forerunner of the 551 was a 3-1/2" version (351?), which would mean that the electronics would have to have supported the IBM-type standard drive. But then to complicate the logic, Atari supposedly had created a 3-1/2" version of the 1050, also. Anyway... has anyone ever seen a 551 with a 6502?

It would be a better idea to drive some 2N3055's (get the RCA brand) or alike with an LM regulator. They can handle more power and
better cooled.

I'd sure love to know which MyDOS you were using and the emulator or
hard drive system that resulted in your finding the directory at
sector 717. Perhaps you were looking at a subdirectory? MyDOS should
always build its main directory at sector 361 thru 368 and then the
VTOC starts at 360 and goes down as far as it needs to to record all
available sectors on the disk or drive formatted. The first byte of
sector 360 also contains the number of VTOC sectors -1, the next two
bytes are free sector count at format, and the next two bytes contain
the current free sector count.

I suspect you made an error somewhere, somehow. At least try it again
to see if you can replicate your current disk as it is faulty by MyDOS
standards and any disk or drive that I have seen using either a large
ramdisk and BUG65 to look at that or a good double density disk editor
on my Black Box looking at a real 16 meg partiton.

http://www.aracnet.com/~atari/whybuyben.htm Well, the contest is nearly half-over! Times getting short. So submit your entry, while you have time!

http://www.aracnet.com/~atari/whatsnew.htm Incoming, incoming!

Hi, I'm Ben Smith of Bravo Sierra Computers. A reseller of Used and New Atari 8 Bit & ST Computer Lines as well as Atari Jaguar Game systems! I'm announcing a Contest! Whoever can write the best Submission for the "Why you should buy Atari from Bravo Sierra Contest!" My Customers are living examples of why to buy from Bravo Sierra! More satisfied Customers & the number keeps growing! Submissions judged on persuasiveness. Originality would be nice but not required. Personal testimonials preferred! Please include your real name (No aliases without your real name!) and where your from. Please submit your entry by Thursday, August 15th. Contest will last 6 weeks, but could last longer should I deem necessary. Prize for the most persuasive entry Wins $25 U.S. Dollars in Cash or Money Order. Entries can come from any Country! All entries become the property of Bravo Sierra Computers! Please E-Mail all entries to atari@aracnet.com plus results will be shown at the HotLink Below!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@aracnet.com. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Bravo Sierra Computers has moved to a new Internet Provider atari@aracnet.com Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on the web at http://www.aracnet.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@aracnet.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

There was an upgrade XF-SPEEDY this replaced the 8040 CPU with a 65C02 + ROM
+ Memory. <

Interesting. I had never heard of the XF Speedy. And replacing the 8040 with
a 65C02 sounds like really "starting from scratch".

Howdy TXG, folks

> So ask the programmer of FlashOS program if he can tell you if on which
> address block 0,1,2 etc is 'burned' in to the Flash and then you have all
> info needed.

I'll do that.

> I would like to help you out with the dissassembly.

I'ld love to do that, but unfortunately, have no time for such a big project
at the moment. But you can begin without me.....:-))

The main reason why I want to be able to read out BB code right now is that
I'ld like to be able to put it up on my site so that everybody can update
there BB ROM. (I'ld prefer it if people would all convert their BB's to
have FlashROMs, but that probably isn't gonna happen very soon)

Actually, I was thinking about using some power transistors to drive
the current, you're right, they will handle the current better with
less heat. I was browsing through the chapter on power supplies, of
"The Art of Electronics", and that's what made me start thinking about
it. The way I have it designed, I can always go back and add that if
the board produces too much heat.

Bob,
I didn't realize the 1050s ran on 9V AC. That does change things.
Yeah, I could do a square wave generator, but that adds a lot more
complexity than I planned on, and frankly, I don't have any expience
doing AC power supplies. In fact, all the circuits I've ever built are
DC (with the exception of using a transformer and rectifier to create
DC from AC).

Oh well, that kinda sucks. Blows my whole reason for doing my own
supply.

Hi,

This wasa mistake. Atari has even printed this info in there manual from DOS 2.5 for the XF551. These specs are from the 1050.
The XF551 uses the 8040 cpu + external ROM or 8050 cpu with internal ROM.

There was an upgrade XF-SPEEDY this replaced the 8040 CPU with a 65C02 + ROM + Memory.

Back in my old days of computer repair, we were a little more drastic,
and we called it the "Six inch diagnostic drop." It was usually a last
resort, but it's surprising how many times that fixed things. We were
dropping the components onto a carpeted floor, though, so you needed
the extra height ;-)

Congrats. The 6502C was a redesign of the 6502B that eliminated the need for 3 chips IIRC. Sounds like you have one of the early models and I would advise you hold onto it.

The only versions have value, at least to me, beyond the 6502C versions. Rockwell 6502Cs have a tendancy to go up in smoke and they ain't making any more of them puppies. The older boards like you have let you plug in a 65C02 which cuts power consumption and gives you an expanded instruction set.

You are also supposed to be able to use a 65802 but I have never been able to find one. Closest I ever came was Apple turbo mod that used one that went up for auction and I lost.

(What's the objective of Koules.)
Shows what kind of game I like, not too hard.
You move your man around and shove the Koules
off the board. There are really 'heavy' balls that
suck you in. I don't remember real well, it has been
so long since I played it, just remember I liked the
game, one of few I actually finished. You have to
avoid getting sucked in by the 'black holes'. Dang,
I can't remember. How about porting it to the PC?
I'd like to play it again. (I know you don't use Win.
so I guess that's out.) You have to accumulate weight
as I remember to be able to deal with the BIG BALLS.
I dunno.

4035. Re: MyDOS disk layout

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-19 18:54:04 UTC
From: pdavis68@hotmail.com
Message-ID: <8e43b66c.0208191054.246d96cb@posting.google.com>
Source record: 28158

I am running MyDOS 4.53/4 using Atari800Win.

The disk I created is 65,535 sectors (16Megs). The VTOC starts at sector 561 I believe, this is off the top of my head, I don't have the info here at work) and the main directory (not a subdirectory) starts at sector 717.

The disk has 128 byte sectors (according to the .ATR header).

The directory begins at the 91792nd byte in the file. 717 x 128 = 91,776. Add 16 bytes for the .ATR header, and you get 91792.

The .ATR file works fine with MyDOS, but obviously doesn't show anything with Atari DOS and fails with several utilities for dealing with ATR files, including one that is specifically supposed to work with MyDOS. I've sent a copy of the file to that utilty's author.

If you would like a copy of the .ATR file (it zips down to about 26k), I'll be happy to e-mail it to you for your perusal.

If you'd like to test this, create a blank disk. Run MyDOS 4.53/4

Select the "O" option. Configure as a high capacity drive with 65,535 sectors

You should be able to reproduce my results. I wrote DOS to create the directory.

Something is wrong here. (65,535)(128) => ~8 megs. You may want to start
over with a fresh image just in case this one has some errors in it.

4039. Re: XF551 with 6502?

The 3.5 inch 1050 was a 1055 - saw one, but didn't buy it..... the 3.5 inch XF was an XF351 - looks like an ST drive. The manual that came with the early XF551s (DOS 2.5) claimed it had a 6502.... not hardly. Putting a 6502 in one would be a bear.

#1 that SIO cnnector is 13 pin; I once salvaged 2 jacks from a dead 1020 printer, but both plugs and jacks are not common. Try Best or B&C.

#2 unless Best or B&C have these cartridge receptors, you are down to scavenging old 400, 800, 600XL etc. units.

#3 the least amount of hardware is needed when you can disassemble the code and remove what checks for RAM by writing to cart memory as copy protection. The Cart Clone solution wired a 74LS04 thru a DPDT to toggle the RAM/ROM configuration. I inherited an 800XL with this built in rather than have a plug in cart needed. Can provide the schematic if helpful.

Hi Ron, That's what I was looking for. Going through the reference material I found I can create a cartridge that plays with the rd4 and rd5 lines to make the machine think ROM is there. You agree that I would still need to hack the cart code to keep it from verifying that by attempting to change the contents of the cart area? Making the custom art doesn't cover that possibility?

Andy

Sector 360 would start at offset 91792 on a disk with 256 byte sectors.
3*128 + (360-3)*256 + 16 = 91792.

If 128 byte sectors, the disk would only be 8 meg.

That's write I have all prototypes that where left after KP did quit the
Atari 8-bit scene. I have build one myself but it didn't ran stable, this is
a know thing with this upgrade and also why it wasn't sold I think. But when
I can make 1 working version I would have a reference and could build maybe
some more.

But ask me if you need more info...

I.i.r.c. the Speedy-XF uses a 6502, replacing the original processor, but this is a third-party upgrade, not a factory-made
peripheral...

XF-Speedy was indeed a third-party upgrade like the HAPPY, SPEEDY, US
DOUBLER & SUPERMAX for the 1050...

Thanks, Pete. As both Ken and Rick have stated, you can't have a 16 meg
image using 128 byte sectors. I would think the best way to create such
an image file would be to start with a blank file of zeros of the correct
size, then rename it .atr and then have the emulator mount it, then see
if MyDOS will format it. I'll give it a try and see if I can do it, but
I don't know if MyDOS will readily accept such a 'disk' as usually when
using a real hard drive, one would use a Format Utility to do the actual
formatting. Using the built in disk formatting routines of MyDOS often
lead to 16 meg partitions with 708 free sectors - which is a real
problem. OTOH emulators as good as they are may also have such foibles,
it might be best to see if some kind soul will email you a zipped image

already done years past?

4052. BASIC compiler in BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-20 11:17:37 UTC
From: PeterH <s9918227@student.up.ac.za>
Message-ID: <3D622551.FFA3AABE@student.up.ac.za>

As part of my university compiler construction course, I hit upon the idea of writing a compiler for Atari 8K basic in basic. Would like to know three things, though:

1. Would this work?
2. Is there any point?
3. Where can I find a list of the ATASCII codes of all the assembly language commands and a brief description of what they do?

.Peter

Hi Peter,

> As part of my university compiler construction course, I hit upon the
> idea of writing a compiler for Atari 8K basic in basic. Would like to
> know three things, though:

> 1. Would this work?

Yes, of course. In fact, there is even an Atari 8 bit basic compiler
that's written in Basic. This is the ABC "Monarch Data" compiler.

> 2. Is there any point?

Well, if this is for an university project, you could learn something,
in fact.

> 3. Where can I find a list of the ATASCII codes of all the assembly
> language commands and a brief description of what they do?

Huh, do you want to learn assembly for it? Ok, I suppose you'd need
an 6502 programming manual then, and quite some time to study it.
A good starting point would be:

http://www.6502.org/

However, I suppose it might make more sense to either generate a
p-Code (similar to what the ABC compiler does), or to generate the
assembly in text form and run it thru a compiler for the final output.

In fact, you still would have more to provide than just the compiler to
run the compiled programs: You'd need to provide some runtime library
that implements the basic commands (like PRINT or DRAWTO). Most of
this is basic Os communication, though.

So long,
Thomas

You can use the 74LS86 or 74HC86. That is pretty much it unless you do it with AND and OR gates.... Try Jameco or JDR Microdevices online. They both do mail-order.

OK - I retract that statement about the manual. All of my loose-leaf MAC65s
were BUG65 and all the bound books were DDT.... except the next one I found.
It is a DDT in a binder.

This is called PILL and is under something like 'Dummy cartridge' on
Craig Lisowski's site: http://aegis.mcs.kent.edu/~clisowsk/8bit.html. I
wrote you that ;-)

> You agree that I would still need to
> hack the cart code to keep it from verifying that by attempting to change

The hacked dumps of cartridges are already available in form of ATRs or
EXEs. If you use PILL, you don't need to hack anything.

4063. SIO2PC problem

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-21 02:04:38 UTC
From: Pete Davis <pdavis68@hotmail.com>
Message-ID: <3d62f507$1_4@corp-news.newsgroups.com>
Source record: 28183

I'm running SIO2PC and I can't get it to work. I built the cable myself. I've double-checked over and over, and all the connections appear to be good. I've double-checked the cables to see that all the lines are going to the right place.

Now, I ran a serial port monitor, and when I start up the computer, I get the following stream of data over COM1:

00 00 31 53 00 00 84 31 53 00 00 84 31 53 00 00 ..1S..€1S..€1S..

Let me rephrase what I said. Code disassembly and patch eliminates need to
toggle rd4-5; it is a software solution needing no hardware.

The Cart Clone and equivalents are hardware and make RAM appear as ROM thus
software alteration is unnessarry.

The SIO plug is still 13 pin...

Hello Pete-

* Can you boot your PC with (a real) DOS disk and see what happens?
* Which cable did you build (Max 232 or?)
* Did you connect the RI line?
* Running at regular SIO speed (19.2K)?
* To get it running, don't have any more than 1 real drive in the system.
* Whose plan did you use to construct the cable -- Nick Kennedy's?

Larry

Larry,
I don't have a DOS disk (for my PC), believe it or not.

The cable I built is the Nick Kennedy one with a minor modification. I used a National Semiconductors 14C232 instead of a Max232, so I replaced the 22uF caps with 1uF caps.

Otherwise, it's wired exactly as in this image:
http://www.tcainternet.com/wa5bdu/sio2pc.gif

So, as for the RI line, yes, I did use it.

I didn't have any real drives attached to the system. Should I boot off of a real drive?

Pete

That will make troubleshooting difficult. You might see if you can borrow one from a friend

> The cable I built is the Nick Kennedy one with a minor modification. I used a National Semiconductors 14C232 instead of a Max232, so I replaced the 22uF caps with 1uF caps. <

Hmm. I can't respond to that other than to say that the cable as drawn up by Nick works very well.

> I didn't have any real drives attached to the system. Should I boot off of a real drive? <

So long as you have "mounted" a bootable image as D1, then you should have no problem.

Larry

I guess you checked all the configurations in the
sio2pc software (either APE or sio2pc.)
The serial line on your cable, I bet, is RING,
APE, I think defaults to DSR.
Other than that, I dunno.

Hi Pete,

The data from your serial monitor looks fine. SIO2PC doesn't work under Win XP. You shoud try either APE for Windows (shareware) or Atari810 (freeware), both of which work under XP.

www.atarimax.com (APE)

www.retrobits.net (Atari810)

Thanks Dan.

Actually, APE has been highly unstable on my machine. I'm going to have to uninstall it. It crashes a lot and won't unload from memory, even trying to force it from task manager.

I'll give 810 a try. Thanks.

Pete

Dan, no luck with 810 either, but since you provide source, that gives me a big head start. Tried it with and without atariSioDriver.exe running. No dice.

Using Nick Kennedy's schematic, I thought it was possible that I had the diode on the "Data to Atari" line backwards, but that doesn't appear to be the case (tried it both ways and with just a jumper). There's nothing about what kind of diode to use. I'm using a 1N914. Maybe it's not a good choice.

I'll probably drop by radio shack tonight and pick up a 1489 and try the circuit Rick Cortese built.

I have to say, your SIO2PC cable is nicer than mine. Mine's on a big ugly prototype board between the two cables. If I can't get it working, maybe I'll bid on the one you're selling...

Whew! Only time I have seen something like that is when it is wired wrong.
The boot sequence for an Atari should be nothing like that. The system just
basically looks for a boot device and this doesn't take more then a few
tries and a few bytes.

The two things I would check first are the +5V and ground going to the chip.
Next I would check the data out<Orange> from the Atari all the way to the
IBM serial port.

Hi,

I have many new Crossbow carts , but the boxes have been damaged by
water a long time ago.

Crossbow isnï¿½t the most wanted game of the world and certainly not as
cart without box.

So can this cart be used for own stuff ?

Is Crossbow a 32K/64K or 128K cart ?

I have an Eprom Burner and some old EPROMs (which contained PC BIOS).

I have at least 10 of these carts with heavily damaged boxes.

Thimo

Oops, I think I e-mailed Richard instead of replying to the group.

Okay, I initially wasn't paying attention and plugged my probe into the ampmeter instead of the voltage meter. Doh. I'm surprised I didn't blow the fuse in my multimeter.

I'm getting 4.9 volts from +5 to ground. I'm getting about .03 between the data out (orange) to ground. I think when I reversed the diode I may have put it in backwards (I think I had it right the first time. It's a 1N914. It's half black, half orange. I had the black end to pin 12 of the 232. Is that correct?

Atari data out is right, it uses positive logic. The side of the diode that
is closest to the MAX232 chip/MAX232 output pin should be reading about -9V.

4083. Re: SIO2PC problem

Newsgroup: comp.sys.atari.8bit

I reversed the diode, and the data appears more orderly out of the serial port monitor. I get a 0xFF followed by a long string of 0x00s.

However, I'm not getting -9V on the "inside" of the diode. I'm not using a MAX232. I'm using a 14C232 (a National Semiconductor IC. pin for pin compatible, for the most part).

The voltage, on both sides of the diode, is pretty close to 5V relative to ground. Do I have the diode backwards?

Nope, the voltage doubler/inverter isn't working -=at all=- from the looks of things. It could be something like a reversed or shorted capacitor. You have about 4-5 of them right? IIRC some of the polarities are right when they look backwards. Could be a solder bridge too for that matter.

I made a mistake on the output levels I think; when the Atari is putting out 0V you should see +9V on the output pin to the diode and when the Atari is putting out +5V you should see -9V on the pin. This will trasition much to fast to see with a VOM but you could see it with a scope or a LED. 5V is not good news.

4085. Koronis Rift Loading

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-22 03:48:08 UTC
From: Eric Scharff <edsZZZ_2@yahoo.com>
Message-ID: <3d645ef8@cs.colorado.edu>
Source record: 28107

(An emulation question, with apologies to real Atari users.)

I am attempting to run Koronis Rift for the Atari 800 in a PC emulator (Atari800Win 3.0). The splash screen with the Lucasfilm logo comes up, and then the green Koronis Rift startup screen. From there nothing seems to work. A green cursor blinks at the bottom right corner of the screen, perhaps on the real screen, perhaps added by Atari800Win. Pressing various keys and pushing joystick buttons doesn't seem to do anything.

This seems to happen on a number of different disk images for this game, so I suspect I'm doing something very foolish.

Any help would be greatly appreciated.

-Eric

Source record: 28108

I've got 4 electrolytic caps that are 1uF. I believe they're all properly laid out, according to the doc and the data sheet. The negative is pretty clearly marked on all of them.

I'm sure it's possible I screwed one up. Wouldn't there be a short in the cap if I had it backwards? I checked them all, adn none of them are shorted.

There's also a decoupling cap (ceramic) between +5 and ground. The writing on it is 104. I think that's .1uF, but I'm not sure.

Just to let me know when I do have it right, what kind of data should I see go across the serial port when it is working?

It's getting late, my guess is I'll rebuild from scratch tomorrow. This one is getting a bit messy from desoldering and resoldering connections (and reversing the diode several times).

I appreciate all your help. Thanks.

Me too (Agent USA at work). Thank God for the emulators.

As for Eric's problem, I'm not sure. I haven't played Koronis Rift, and while I like Atari800Win, it does have problems with a number of programs (Action! can't load or save code, Ultima III won't let me into cities and making characters is a bit sketchy too, etc...)

It's possible that it just doesn't work. I've fixed a couple of bugs in it which I tried to report to the author, only to have the e-mail returned. In general, though, I find it very difficult to fix the bugs. Mainly because I don't know the Atari inside and out.

Pete

4089. Seeking info on space-sim game...help?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-22 04:30:53 UTC
From: Buckler <ohxxyre@lnubb.pbz>
Message-ID: <njp8musb0u3ps34rm1ohhr1lql16nte4bf@4ax.com>
Source record: 28111

Hi folks. I was hoping someone here could help me to identify a game I spent many an hour playing on my Atari 800, right around 1985.

It was a first-person space fighter simulation; the player was cast as a pilot charged with helping to eradicate the forces of a corporation called the PRC. Kills were tallied, and as you docked at various landbases to take on fuel and repair your ship, bounties would be paid out for your collected kills.

Further details are sketchy, but I recall that the energy weapon systems had three modes: beam, wave, and cone; each mode applied damage differently. I recall that one type of enemy ship was called the "PRC Exxonerator".

I seem to think the title of the game was simply "Star Fighter" (NOT the one released by Atari), but I could be wrong.

Any information you can provide would be appreciated.

Thanks much,
Buckler

After some poking around here is what I come up with. I'm using Atari800Win 2.7b. It creates a large .atr just fine, but won't allow MyDOS to use the 'Y' (sio21) option to format it as double density. I get error #146 which is 'Function not implemented in handler', which can't be - so it must be a fault of Atari800Win not allowing it, but handing MyDOS that error code to report. Oddly enough, it does allow you to use the 'A' (sio22) option to format which should be enhanced density only - but the results appear to be in double density anyway? I get the opposite functions when using a real hard drive in that option 'A' errors out and only 'Y' will do a proper format - and this is the way it should be in the emulator too using a double density .atr

Ken's formula on the face of it looks to be exactly right - but there is a built in flaw with it. Look at this cheesed version to find the offset to sector 1.

(1x128) + 16 = 144 or 90h

That's just plain wrong as the first sector starts at 16 or 10h offset. I thought that the 'no sector zero' disk system was supposed to help just this very kind of calculation(s) error!! This revised formula shows that Atari800Win is doing it exactly right. This (better?) formula avoids multiplying by zero for those systems who might crash doing that.

SD & ED
(360x128) -128 +16 = 45968 or B390h

DD
(360x256) -256 +16 -(128x3) = 91536 or 16590h

The .atr I created appears to be fine in every way. But there does appear to be something slightly wrong with MyDOS and big disk formats. Different versions of MyDOS result in different format data. 4.51 reports 65,472 free sectors and the VTOC starts with FFh as byte 1 - which is an obvious fault somewhere. 4.50, 4.53/4 and Fmt.com (only used on the Black Box) all report 65,491 free sectors and the first VTOC byte is 23h-35. But if you count 34 sectors down, the end of the VTOC is not there in any version, emulator or real hard drive??? The emulator creates a 'long' .atr image in that it ends at offset 00FFFFFFh-16,777,215 and when corrected to 00FFFD8Fh-16,776,591 for 'short' boot sectors and then formatted - its length is back to 00FFFFFFh??? The .atr header is correct to begin with and does not change, however.

In testing various things out I have come across a major bug in MyDOS 4.51. FFh as the first byte of VTOC sector 360 is just one symptom, wrong data is also stored thoughout that sector when using 4.51, so I would not suggest formatting a very large disk with 4.51 or our beta2 derivative till I can get beta2 fixed. VTOCfix.com should be run on such a drive, which is something I forgot to try last night. I do recall one of the co-authors commenting to the other in the source code for 4.51, 'Do we really want to do this?', I think I'll start there. :)

Crossbow is 128k XEGS bankswitched cart. Schematics could be found on my page.

I sent some info to Thorsten S. how to make homebrew 64k cart, which was verified. I also send him the possible way how to make 128k cart, but this was not confirmed yet (I don't have resources to try it by myself).

This is the HTML MAC/65 manual I did, but it's for the disk-based version. Later there were notes inserted with extra
info/differences with the cartridge-version. However this is not a straight copy of the original manual. all info is on my page
(it all came from the original manual), albeit sometimes in a different order, or different numbered chapters...

You're finding, more or less, the same results that I ran into with how
MyDOS formats. It may very wellbe a bug in Atarin800Win.

It does work, I just made 100% sure..

Best step thru I can think of is

1. Make sure it's in XL mode by the ATARI tab and select it in the
machine type.

2. In the same TAB look for OPTION and tick disable basic

3. Same place Again, make sure SIO patch is ticked. Only reason I say
this is because the program loads a lot of sectors according to my
sector counter and if SIO wasn't patched it would take a good while.

If none of this fixes it then mail me and I'll help you with the image
as it might be stuffed?

Since you verified your parts are good then it is probably down to something like a solder bridge, bent out pin, that kind of stuff. The starting from scratch idea you posted is probably good or do the 1489 design. Then again I would probably sit there staring at the thing for 10-12 hours trying to figure out what is wrong; kind of obsessive that way. The 1489 design is much easier to execute and you can pretty much reuse all the parts you have now.
> Just to let me know when I do have it right, what kind of data should I see
> go across the serial port when it is working?

Argghh! I should really go down in my basement and get my OS listing so I can be sort of accurate. On boot I believe the Atari just sends a 5 byte status command looking for a response from the disk drive. I don't remember how many retries it does, 3-5 I think. The format is

Device ID which is always $31 for the first disk drive. Ataris only boot drive one.
Command which is $53 or S for (S)tatus
two AUX bytes, zeros for status I think.
Checksum <no idea what it is or how it is calculated>

I'm not sure if it is inverted data now that I think about it. Worse case is you have to invert it by doing an exclusive OR with $FF.

Does anyone have any instructions or further info on this game ? I just grabbed a copy from Holmes (since I've never heard of it before much less played it) and it looks very interesting.

Been bashing keys randomly but would prefer to have at least an idea of what to do ;-)

Cheers

Paul

Thomas,

The board holds the few electronic parts and two holders for the Pokeys.
When the original Pokey is in a socket, you can simply remove the Pokey and
replace it by the Stereo board. The addition to Gumby is a switch used to
turn the upgrade on/off. The upgrade is more Pokey-chip 'friendly' because
you don't have to solder on the chips. :)

Freddy.

Yeah but it from the Technical Ref, Revision A I think. Not like it revised
version with the PBI handlers.

Oops, Richard, I did it again. I e-mailed you instead of sending to the group, but this time, it went out by accident. I hate when you hit a shortcut by accident :-(

Okay, it looks like it was probably working partly. The bytes coming to the PC were:

Damn, I did it again. Ctrl-Enter. ARGH....

Okay, this is what's coming across:

31 53 00 00 84

That would be 31 for drive 1, 53 for status, 2 zeros, and finally, 84, which looks like a regular sum.

So, the data was coming over to the PC, it looks like it just wasn't able to reply to the Atari. Bummer. I found a 75LS189 in one of my drawers, so I'm going to go with the easier method. Got plenty of parts to try with.

I'll let you know how it goes.

A somewhat better solution is to add a diode across the relay coil with the cathode towards the positive voltage, and add a non-electrolytic cap across as well (something between .01 and ~2uf is fine- the value isn't critical). Relay coils don't have polarity and reversing which side of the transistor its connected to can disturb the operation of the circuit- and it won't affect the spikes either. Changing the location of the coil will change where the spikes are seen, but they're still present. When a relay coil is actuated, 2 spikes are seen; one as current is applied- its polarity is opposed to the polarity of the actuating current, the effect is to slow down the current rise thru the coil- its not really noticable in this scenario. The other spike occurs when current is removed. Since the current is abruptly stopped, the magnetic field collapses very fast, applying current to the circuit connected to the relay. Since the circuit's resistance is high (the transistor being off), E=IR causes a (very) high voltage to develop- easily over 100v. The polarity of the spike will be the reverse of the polarity of the current applied to actuate the coil, thus the reversed diode will pass the spike's current but not the actuating current. The duration of the spike is proportional to the circuit's resistance, the higher the resistance, the shorter and bigger the spike is. The diode and cap will short the current spike right back to the coil so the rest of the circuit effectively won't see it.

> (Don't worry about the Atari powering the relays themselves, I know
> for a fact I will need an external power supply.)

A 3904/3906 can handle up to about 1 amp, so you can pile up a bunch of relays.

4111. SIO2PC #2

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-23 02:28:33 UTC
From: Pete Davis <pdavis68@hotmail.com>
Message-ID: <3d659d9f$1_1@corp-news.newsgroups.com>
Source record: 28133

Okay, I'm still having problems. ARGH.

I did the 75LS189. At least Atari810 is showing something, but it's basically showing "Unknown" and all the data coming across seems to be zeros.

I added the diode, but I may remove that to make things simpler.

I've got a .1uF cap between pins 1 & 14. I may also remove that, again, just to get rid of possible problems.

I've got no shorts between any pins (my multimeter has a setting for checking just that). I had two, but I cleaned them and they're fine now.

There's no short anywhere near the diode (from the Atari orange line to pin 8), but my multimeter is showing about +5V DC relative to ground there, on both sides of the diode.

For once, my soldering job is actually very clean. Pins 13 & 14 are tied together cleanly.

Pin 14 shows +5V relative to pin 7.

Any ideas? Sorry to be such a pain... I want my SIO2PC :-(

Pete

My main point though was that the .atr that Atari800Win made for me, was fine in every way. I sent it to you by email, now let's have a look see at yours. And VTOCfix.com works very well on the mis-written 4.51 VTOC data, so that can be a temporary fix for now. Use the hex editor to veiw the structure of an .atr - in particular the offset to the VTOC. Or any file.

I found a version of the 75LS189 circuit on a Czech website that has an 1uF electrolytic cap between pins 14 and 7 as well as a direct line from pin 13 to ground and a 5k6 resistor between pins 8 and 14.

What's this all about?

Okay, PROGRESS!!!!

I removed the diode and the cap between pin 1 and 14.

Atari 810 gets the status signal, and sometimes, will begin to boot, but
then it loses it somewhere along the way. Usually it gets to sector 2-5,
though once it made it to sector 13.

Any ideas on what might clean this up?

Am I correct in assuming that a ceramic cap with 104 written on the side is
a .1uF cap?

This was the main point. I turned *off* the SIO patch, assuming it was
doing some timing-specific stuff whilst loading and got messed up.

The *real* problem was that I wasn't patient enough.

For the record:

The game isn't done loading when the splash screen comes up. In fact, it
still has quite a bit to load.

If you press a key while it is loading, that interrupts the load sequence
and messes everything up.

So, if you simply hit *no* keys, and wait a half minute for it to finish
virtually loading, it works fine.

Thanks to everyone for their help!

> Any ideas on what might clean this up?

There is such a thing as a bad POKEY/Atari serial chip. I have also fixed
one for somebody that just had a wire broken loose in 13 pin hood. Could be
anything really. Both SIO2PC and APE have built in monitors that will give
things like error codes.

I would make sure you have a single density image that isn't Sparta DOS.

Just to make sure, are you doing this in a 1200XL?

If you want me to look at the cable I will fix it<them> for you. Kind of
curious myself now.
>
> Am I correct in assuming that a ceramic cap with 104 written on the side
is
> a .1uF cap?

Yes.

In answer to your other post about designs, the reason for the other designs
was because ~70% of the people trying to build Nick's MAX232 design had
problems with assembly. I started off with simple designs based chips like a
74LS00 and 4049, but people were saying "There are no 4049s in France" kind
of stuff. A look through the Radio Shack catalog showed they stocked 1489s
and everyone seemed to agree they could get them.

I think in my first 1489 post to the newsgroup I said a few things like you
could add a decoupling capacitor but I left them out of the original design
just to keep it simple. There are a few other things I and others took the
liberty of changing. When I first did the design I tied unused input to
either +5 or ground. I found out later that this is unnecessary as they have
this on chip already. I am a minimalist I guess.

Some people say they get better performance with a pullup resistor so they added it to the design. Actually I think it should be a pulldown if anything but people swear by the mod.

IMO: Ask what
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2047189734

is doing under the hood with his. He has 132 feedbacks, all positive!

Hi,

Q: When will be full version of the game released?

A: I have no idea. I'm still looking for a creative person to design the levels and draw the graphics.
Thanks for all your entries in the guestbook, it's the reason why this project isn't dead.
But it won't step any further without a person that will cooperate with me (I've started this project because I had many promises).
Do you really want to have a new 3D game for a very very old computer? I only have the 3D engine, does anyone want to do the rest?

Are there some good Duke Nukem Level designers in this news-group who can make levels also people who can make graphics.

Lol..Patience is a virtue :-)

Glad it's working, I think most people forget the real Atari's were
not the fastest loaders in the world and with the emulators running
with the I/O off they can actually load slower than the real thing
sometimes.

Always keep the fast I/O on unless the program simply won't work on
any other configuration, then try with it off.

Richard,
No bad Pokey (I tried another Atari). It's been tested with an 800xl and
130xe.

I guess I'll just double-check all the connections and stuff, pull on the
wires, rip out my hair, etc...

I've got enough parts that I can continue this exercise 2 or 3 more times
before I need to go out and buy more parts. Eventually I gotta get it right.

I realized I had screwed up the coupling cap. I had misread from Pin 1 to
Pin 14, and it was Pin 7 to Pin 14, so I put that back. Put the diode back
in as well. The performance is the same. It sometimes just shows a status
for the drive, other times it will start reading sectors. Sector 13 is the
farthest I've gotten.

Okay, additional tesitng and messing around with the setup, and I'm pretty much in the same place. I tried reversing the diode. Clearly, I had it right the first time, as the Atari receives nothing if I reverse it.

It appears that the Atari is sending data and the PC is receiving it. The problem appears to be that at some point, after the first few frames, the Atari stops receiving data for some reason. I've rechecked all line associated with the xmit line, from the DB9, all the way to the Atari's orange cable. All the connections have been de-soldered and resoldered, and no dice.

Is it possible that running a pull-up or pull-down on pin 8 would help?

Could it be some sort of grounding issue?

Thanks.

Pete

I think it's great that you have the MAC/65 manual on your site. I was looking for an online "Action!" manual and never could find one (though you do have the quick reference).

Since nobody else seems to have it up, I thought I'd do it. How did you get the MAC/65 manual done? Did you scan and OCR?

Now that I actually have the real manuals, I wouldn't mind getting them up for the sake of others.

I did that and it still glitched.

I don't see how changing from using a transistor in source mode or sink mode
can disturb the operation of the circuit. Both ways are pretty standard.
There is no way to get rid of the ~.7V spike you still get with even with a
clamping diode. The .7V was enough to glitch the computer in one mode,
didn't bother it in the other.

I meant just the simple rom replacement/rewiring. Your design I've seen
was using too many different parts and additional board.

So is your verified 128k design just rom replacement?

Well,
I think the first version made by chuck steinman is the best known one.
Afaik Freddy Offenga (or another dutch atarian) also made some Pokey
upgrades which have the same function but use different layouts (or
PCB`s). The chuck steinman upgrade is described in an english article
(AT/ASCII text)... -Andreas.

Source record: 28059

Well,
it can be used - but with limitations. I have a good article written by
nir dary, who describes it (also includes a copy routine for homebrew
games)...
The limitations are: 1) XEGS carts cannot be switched off, thus the game
must not use (nor write to) cartridge area 8000-BFFF (since this area
will be ROM after you insert the cart!); 2) the game must not be
multistage, otherwise it will try to load the nexts parts from Disk or
tape (unless you are a good hacker/patcher and are able to change
this...) 3) the game must not have a certain copy-protection, which
detects the presence of a cart and then locks-up (some games have this
protection, to protect them against cart. hacking tools...)
-Andreas.

It depends on the type of transistor, if NPN, putting the coil between
the emitter and ground interferes with the base current- a similar
arrangement applies for PNP. I guess its not all that important in
this case- such things are more important when dealing with
amplifiers, not transistors in saturation as switching devices. It is
worth noting that the current gain of transistors in that
configuration is reduced- again its probably not all that important
here.

I've no doubt moving the coil around might cause the problem to not
appear- it all depends on where the spike shows up. The spike is
there because of the diode's voltage drop, thats what the cap helps to
get rid of.

If it was still glitching with both the cap and the diode, I would begin to suspect some other unforseen interaction- perhaps thru the transistor's base. I worked on one circuit where ground noise caused the net VCC to drop below the device's minimum for just an instant- but enough to corrupt memory.

In situations like this, it helps to increase the switching times of the coil. The faster you change the current in the coil, the bigger the reaction in your system, so slow it down. Maybe a little R/C low-pass network at the input... The joystick already has a resistor in series, try a capacitor to ground at the base. Maybe 5ufd.

The real fix is to use an opto-isolator to the outside world....

Bob

Hello All,

Just wanted to clear up some confusion over my Atari 8-bit PPP/DGS CD-ROM. Based on e-mails I've had recently, it appears some people think that I only have 25 copies available. This is untrue. I am allowed to produce as many as I need. The 25 copies I have mentioned recently, is the number of copies I need to sell to reach break-even point. At the moment I am out-of-pocket because I've only sold 13 copies. Please take a look at the info about the new CD at http://www.dgs.clara.net (click the CD-ROM link). You can order on-line with a credit card using PayPal, or pay in cash in US$ or UK pounds.

I can't answer, but I can make a few stabs:

* Licensing?
* Shipping?
* Nifty graphics on the CD itself

It sucks about the "can't sell to Germany, Switzerland, Austria" bit.
What's up with that!?

-bill!

Okay, I made my THIRD cable. This time I used the Czech design that has the pullup on pin 13. I get EXACTLY the same result as with cable #2, meaning that chances are, this is a grounding issue.

Okay, let's throw in one more variable, which is this: My laptop only has USB ports, no serial port, so I'm using a USB to Serial cable (it's got some circuitry inside). I didn't build this. I bought it. It's professional. Is there any chance that this is the variable?

Switching the command line to DSR, I got a lot more success, but I had to use APE, which isn't very stable on my laptop and won't unload from memory, which is something I have issues with.

I was able to boot off of some disks, but it wasn't entirely reliable. I couldn't always boot, and sometimes when I'd boot, I couldn't get to DOS. Other times I could. So, I'm still of the opinion this is probably a grounding issue, but I'm still not sure what to do about it. I don't want to have to run a ground line to an outlet. That would be a tremendous pain.

Any workarounds for this would be very welcome. Thanks.

Well, my favorite mistake is soldering the ground to IBM pin 9, 6, or 1.
Then seeing I already have pin soldered think the one on the other side much
be 9, 6, or 1 so I double my mistake output.

That's funny. I did the same thing with the third cable. Fortunately I caught it before I plugged it in. What I didn't catch was the little short between the +5V and ground busses. I fired up the Atari and got a black screen. Hehe.

Any ideas on how I can stabilize this thing? Even if I can only do DSR, that's fine. I can modify Atari810 to do DSR instead of RI.

Pete

I've never really used much but the DOS versions of APE and SIO2PC. Those
run fine even on an 8088. All I would be doing is repeating some of the
stuff I heard that went something like set tast priority<?> really high.

Email me your address. I will send you a cable verified to work right. If
that solves the problem, then send me back a broken cable.

Source record: 28077

Back in the day (1980's) I had a Happy upgrade installed in my 810. Except it wasn't really a Happy upgrade, but a pirate copy of the Happy (now that's irony). Shortly before I went into the Air Force in 1990 my 810 died, so I took it to B&C Computervisions. As it turns out, the B&C folks were friends with the Happy folks (being in the same general area - Santa Clara and Morgan Hill CA) and they refused to fix my drive unless I also purchased a true Happy upgrade.

I then went off to the Air Force and a friend picked up the drive and held it (with my 800) for 10 years...

I finally got it back and it still had the B&C receipt (dated 1 May 1990) taped to the top...in addition to the Happy upgrade ($79.95 installed) my 810 required a side board, $15. I checked their site (www.myatari.com) and the price is still $15. Now that's holding the line on prices :)

Incidentally, the drive didn't work after it was shipped back to me (after 10 years). I had the old side board, the one with the pirate Happy soldered to it (except B&C removed the chips), and between the two boards I was able to assemble 1 good side board, with the Happy chips on one side and the pirate board on the other. Luckily the Warp Speed software disk still booted so I could slow down the drive to boot my original EA disks (guess they didn't like that Happy thing :))

Paul

I can't sell to any German speaking countries because my original agreement with PPP only allowed me to sell outside of these countries. That's because PPP themselves were selling in these countries, and it would be silly trying to compete with my supplier! The German rights have since been sold to another German supplier, so again I can't sell in these countries. I'm not eager to get sued here!!

Costs are indeed licenses. I bought open-ended licenses which cost $$. I also spent 50 hours of my own time putting this thing together.

I could not get a single chip SIO2PC cable to work reliably when using a laptop (Compaq n600c). Works great on my desktop though. May be best to test on a desktop first?

Well, first I found the MAC/65 manual as ATARI Writer text-files on an Atari disk I found in a large pile of floppies I got when I
bought someones Atari-stuff. Since I bought stuff from several people I have no idea from where it came. This was the manual of
the DISK-based version of the MAC/65 manual, and I saved the AW files as plain ASCII-files, then converted all ATASCII eol's to
ASCII lf's and null-modemed them to my PC system. On there I made the HTML version, by hand!

Later, after it was online for some months, I got a mail from someone who didn't want his name published (copyright issue) and he
offered me to scan his CARTRIDGE manual, OCRing it, and mail it to me. Since making the first HTML version took a lot of time I
decided to compare the chapters of both DISK- and CART version and only added the parts that where different. That's why the
online version has the chapter-numbers of the DISK-based version, but still contains all CART-version info. (it remembers me I
still haven't done the DDT manual...)

> Now that I actually have the real manuals, I wouldn't mind getting
> them up for the sake of others.

I don't have the ACTION! manuals either but would like to have it online too, but since I never use ACTION! myself, it doesn't have
high prioriy for me. The person that did sent me the MAC manual also scanned and OCR-ed the whole Sparta-Dos 2.3 Constuction Kit
for me. I started to HTML-ing that one also, but it's a huge manual! Since I don't have the time anymore I had back then, the
HTML-ing goes slowly, however the major part is done. I also have some more info about the "newer" versions of Sparta-Dos (3.2 and
3.3 versions) I want to include also, but don't hold you breath...

Richard, I'm going to try it out with some other computers and see how that works out. If that doesn't work, I'll do a cable trade with you. I appreciate your offer. That's really nice of you.

I'm convinced that the cable is okay, though. I wouldn't normally say that, except that I built two, slightly different variations, and the results were identical. The chance of me duplicating exactly the same problem are pretty slim. Not to mention, the last one is incredibly clean (for my soldering).

Now, I did notice on thing kind of odd. I added a second coupling capacitor to cable #2, during testing, and at one point, it went up to 34 sectors and then stopped. Previously, sector 13 was the furthest I had gotten with that cable (using the RI line). Using DSR, I had much more success.

Is it possible that some variation of the coupling capacitor, could somehow clean up the ground, assuming it's a ground issue? I just don't know enough about electronics to know this stuff.

If this is the case, then it seems there could something wrong with the circuit that keeps it from working with laptops. While I have a desktop, it's not in the same room where I want to use the Atari. It's going to be very inconvenient to use the desktop. In that case, I'd probably just stick with the floppy drives.

Seems to me there ought to be a way to modify the circuit to work with laptops.

Sometimes. What can happen with a bad ground or ground to wrong pin is the
cap can charge up and act like a weak battery to power the circuit for a
bit. From the sounds of things I think you may have it cornered with the
USB/Serial thing.

Do you think it would help if I boosted the current on the Data In line for the atari?

What I was thinking was something along the lines of running a transistor with the collector to +5V, the emitter to Data In and the Tx Data from the pc to the base.

Obviously with some resistors in there, but I'm not sure what values to use.

I don't think so. Reason I think that way is all RS232 chips like the MAX or 1489 have an input resistance of >3,000 Ohms. In the 1489's case, it is really just a 3 transistor high gain inverting amplifier on chip. All the parts like pullups and short circuit protection are already there.

The can be tuned for transistion voltage as they have a response control pin. A problem is we don't know if your USB/serial port is giving problems because it needs a pull up or a pull down.

I've probably built about 30 over the last 10 years. The only problems I have seen other then my normal ham fisted soldering are in multiple drive systems with 2 or more 1050s/810s and one bad POKEY chip.

Some Atari systems just seem more robust. I had one 1200XL that worked just fine using a ProSys cable with a 1489 vs. 14C89 for instance. Darn thing was barely running on 3V but it worked just fine.

4166. Find out the RAMDISK Sequence

The Atari 8-bit FAQ has the numbers for the different upgrades:

http://www.cs.uu.nl/wais/html/na-dir/atari-8-bit/faq.html

See section 3.8.2

As for doing it programmatically, the only way I can think of, and I'm not even sure what the implications would be of doing this, would be to simply set PORTB to 00-FF and write a unique string of bytes to each page, and then cycle through them again and read in the values to determine which ones work and which ones don't.

I don't know how else you'd do it. Maybe there's some sort of internal table or something, but I don't think so, and I don't know where it would be.

I had exactly the same problem, luckily the guys over at the Dreamcast
Emulation forum sorted me out with a good copy -

http://www.dcemulation.com/phpBB/viewtopic.php?t=11188&highlight=mule

you need to grab a copy of the dreamcast mule cdrom from
http://www.irata.info/ (it's in diskjuggler format) - this has a good
copy of the mule.atr in it.

let me know if you have any problems and I will upload or email it,

btw, the dreamcast Atari 800 emulator is FANTASTIC, anyone with a
dreamcast should grab a copy and try it out...

regards,
Mark

I've been reading some of this.
Your description of sometimes working, sometimes
not, makes me think of my setup.
I use APE 1.17. I think my cable is too long or
something else is iffy about it. The DSR line helped
it a lot. I can never get APE Warp (what is it 3X?).
I always configure for 1X and 'Stupid'. If I don't,
I usually lock up after the first few sectors. If you're
using SpartaDOS, 3.2G is probably best, this is mentioned in the
documentation.

Hi,

Ii¿½ve talked to several people and the idea is :

Release new ATARI games , games which are "in-the-making" on ATARI XE carts.

I have about 200 carts of games like Crossbow,One on One,Thunderfox,Pole Position (games are new,but boxes/manuals have been destroyed).

We could release NEW ATARI XE games on carts , just like new ATARI 2600/5200 games were released (look at www.atariage.com).

Interesting games may be Space Harrier or IK+ , if the programmers agree and can make the games run from cartridge AND if we get the rights (System 3 for IK+ , Sega for Space Harrier).

Or other games.

What we need now are : programmers with new games ; people who could design original-looking ATARI XE boxes and manuals.

Thimo

Russ,
Yeah, I can only get it running on DSR. One of the mistakes I made was in reading one of the designs which showed a coupling cap that I mistakenly thought was an electrolytic. I changed it to a ceramic and that improved things even more (electrolytics don't respond as quickly). Rick's original design suggests a ceramic, and I should have stuck with that. I was just trying anything I could think of.

Still, it's somewhat iffy, as you say. I don't think the cable length is too long. My SIO is about 1 meter (~3 feet) and the wires to the DB9 are about 4 inches long.

I'm charging up a battery for a 5V power supply that I made. I'm going to see if adding that in will provide a needed power boost and/or stabilization to the circuit. I'm running out of ideas. If this is going to be of any use to me, it's got to be more reliable than this.

<quote from the ad>
Also, for the most part, there are no program listings in Current Notes -
that's why they had so much space for their great articles.
<end of quote>

I think that's exactly why nobody was going to pay for it. Most of the
people who are into Atari these days are into either playing games, doing
hardware upgrades, or programming, or all three.

This magazine doesn't appeal to any of those three things, at least it
doesn't appear to. It's like paying $40 for a bunch of time magazines from
the 80s. Who cares? It's all outdated news.

Sorry, I think you're asking for way too much.

I'm definitely interested in writing Atari games, whether or not there's a market for it. I'd need some help on art, but I've already started writing a graphics library for the Atari. I could certainly use ideas for games. I'm not interested in doing 3D games. My interests are in tile-based games, such as Ali Baba and Ultima.

I'd do another type of game, if someone had a good idea.

4174. MULE with errors?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-25 04:51:08 UTC
From: Thomas Havemeister <twh1@gmx.de>
Message-ID: <o7ogmucnenn7bss46g0tphbj6lsvim1mik@4ax.com>
Source record: 28089

Howdy *.*!

I have here several problems when playing my version of M.U.L.E. !
When I'm changing my fresh MULE into a Smithore-MULE or Food-MULE or
what ever, there seems to be some garbages on the screen. On the Box
named "Land" only the first letters are displayed correctly. Also the
same to the box left to it. I don't know what to change. I have tried
to find some other version from the net. All with the same error. Now
I've emulated it on AtariWin 3.0 and an OS-B implementation of the
atari rom. It's the same effect.

On the other side, I have watched this effect: When I'm catching this
Mountain-Monster (don't know the name) the screen is totally down.
There are interlaced effects and no normal screen is left.

Can anybody help me? Has anybody a *real* working version for me?

-thomsen

I'm not certain if they list the controllers needed, but AtariAge.com
seems to be quite a comprehensive index of Atari 2600, 5200 and 7800 games.
(Including some of the newest (e.g., release this month: August 2002!) titles)

I've looked at pictures of sio2pc/ape cables for sale on e-bay. They are always only about 1 foot long, I think the same for cables on the APE site. These must (I mean probably) be used with a serial cable and maybe a gender changer, it is hard to get a PC serial port 1 foot from the Atari. I've thought the signal levels may be loosing too much in my 9 foot cable (6 feet PC serial cable, sio2pc box, then 3 feet SIO calbe). Your idea of a power source for it may help.

SD 3.2g took out the ainit, I think.
You could use 3.2d for that, or just boot from 2.5 and use that. As for getting files 2.5<>SD3.2x, just boot SD and copy the files, except the .SYS files, you can go 2.5 to SD or SD to 2.5 using SD.

I think a 3 foot SIO cable is short enough to be prevening a real problem. My atari is about 5 inches from my laptop, so I could cut the cable length down, but I don't think that's the problem.

I tried building the MAX232 version again, this time on a breadboard. No dice. Couldn't get anything out of it. With DSR and APE, quality has improved signfiicantly, but I just can't quite get it to where it's reliable.

I keep thinking, there's got to be SOMETHING I can do to improve the quality.

Putting a power source on the board did show one thing: You can power on the Atari by sending +5V through the SIO port :-) Whether or not the power switch is on.

Weird. Other than that, it bought me nothing.

Maybe I can scan my old Atari 2600 VCS cartridge catalogs... they had a page
where they were listed together with the required controllers for each.

error 168 is 'unknown XIO command'.
That's because you're using SD 3.2g, which doesn't
have that command, I think. I don't understand what
the problem is. You don't have a DOS 2.5 disk to
format with? There are ATRs of DOS 2.5 or MyDOS
you could use. I'm missing something. Uhm, no
PC to use ATRs with, no way to get an ATR to
the Atari? You have a 19 sector ATR. Now I really
don't know. You've got a 3.2g disk and can boot from it.
And you can download stuff and get it to the Atari.
I'm back where I started.

Pete, I think you get the prize for trying harder than
anyone else to get your cable to work right.
I got lost with the ceramic and the other type caps and
the reverse diodes and the ground stuff and especially
having a pc serial port monitor the bytes coming in/out.
APE isn't all that unreliable, I've used it for years.
I do think your laptop, with the USB to serial adapter
is a problem. USB is often flakey. Can you try it on
a desktop? Even a 8886 AT PC will work with
APE DOS.

Unfortunately, the main use IS a ramdisk. There may be some software that takes advantage of it, but I'm not sure what.

I have a few upgraded machines (none with 1 meg). My intention is to write a game that does take advantage of the extra ram, though. When it's out, I'll let you know :-)

As I recall, from the old days, having a large ramdisk was very useful for running a BBS. The main reason being that disk access was so slow, it was much quicker to get it from ramdisk. Other than that, I don't recall using it for much of anything.

Yeah, I can test it with one of my other desktops when I get them up and running (they've been down for a while due to logistical issues and the fact that I'm too lazy to go in and clean up the room they're in). My guess is that it will work just fine, though. I'll keep at it and see if I can find a way around the problem. I'm sure it's just some sort of grounding problem, that surely can be overcome, somehow.

There is a market.I sell ATARI games on ebay since 1999.The classic
ATARI XE cart games still sell very well.And I never had many
different ones.

Some disk games are really worth much money,for example Mule.

I think it would be a good idea to release NEW games on cart,limited
edition,maybe 100-200/game for the European and even more for the
North American market.

If you get $10 or more for an old Rescue on Fractalus cart,you can get
$20-$30 for a new cart.

I have enough Crossbow carts for creating new carts,I only need
EPROMs.

I have an EPROM Burner,ok itï¿½s for the C64,but this is no problem.

So I have only to spend money for : EPROMs and package/manuals (which
should look professional).

So both the programmer and I can earn money for a game.

Some of the new ATARI 2600 games were sold out very fast and I think
the same is possible on the ATARI 800 XL.

I'm not sure if those are rare or not but the "ataritexte" suggests it might be a french translation of "atariwriter". I wonder if either of these would have been available in quebec as well?

even then it would be a very tight fit. you'd probly need to do a strictly text based minix like setup. Even the microcontroller linux I'd seen a few years ago for palmpilot and ST still wanted 4 megs of ram, and that was on the 68000 based cpu's. That would definately be a tough challenge to squeeze it into an 8bit.

I catn remember them all but I think there were a handful of programs that used 128k or so and a number of demos that would use some of that ram, up to 320k anyways.

Thanks for your reply! In fact, I already found this tool on your web
page. But it will not work ! I always get an ERROR 168. I don't know
the interpretation of this error, but this is somewhat uncool.

I've found on Holme's Atari Archiv at
http://homepages.paradise.net.nz/atari/utils.html the tool "Atari Dos
Formatter" by Gleen K. Smith. But the ATRs of Holmes are always
destroyed in some small boot-ATRs, so nobody can use this software.

This means to me: Find the original file version of a SD-compatible
DOS Formatter or reconvert my 19 - sector ATR File (which seems to me
impossible)

Hi Chris,

> I have read that it should me possible to connect a 800 xl to a modern svga
> monitor. Is it easy to do or not?

I hardly doubt it. The Atari generates a standard FBas signal (for
color tvs), with sync rates of 15Khz horizontal and 50Hz resp. 60Hz
vertical refresh rate. SVGA monitors typically(!) expect RGB input and
a minimum horizontal sync of 31Khz. Hence, I hardly doubt that you'll be
able to it. Not without some heavy electronics in between.

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I allways used it with Sparta-Dos 3,2c, and since a long while now with 3.3b and never had problems.

From the SDCK:
168($A8). Illegal DOS command is not possible

Are you sure you're not trying to format in double density on an a diskdrive which is not able to? (like standard 1050).

SINIT D1: /S should format it in single density...

Hello Chris
> I have read that it should me possible to connect a 800 xl to a modern svga monitor. Is it easy to do or not? <

Easy, but does require off-the-shelf hardware.
Until recently, I used an (external) JAM!! and then "Instant TV" to connect my A8 to my PC monitor. Now I use an ATI "All-in-Wonder" video card that has a video port input. The advantage is that by using a video card, both the PC screen is visible along with a scalable window of a video input (TV, cable, Atari, VCR, DVD...). There are a number of devices that can do what you want -- TV cards, USB, etc.

Of course, that also means that you have to have a PC attached, while the previously mentioned external devices *should* work as stand-alone (I never tried stand-alone).

Do a Google search on VGA Converter or Scan Doubler. For the best display, make sure that an S-video input is available. The S-video display on a PC monitor is SUPERB.
One caveat, though is that you will see no artifacting, so if you have games that depend on GR 8 artifacting, you will see B&W.

If your 800XL is "stock", you may want to upgrade the video. Only the late-model 800XL's (Taiwan) had decent video (IMO)
Larry

as far as I know, there are several out-of-the-box solutions for
playstation, dreamcast or amiga. These are typically around 60-90ï¿½ and
are awaiting FBAS input. But for now, I can't remember a special
product. This was a topic for some month ago in this group. I'm sure
the guy who posted it will answer to you.

Generaly, I think it's not too complex to connect Atari to SVGA. But
it's probably not the best output. My experience with Atari
screen-quality: you will get the highest picture-quality with an
monitor or video monitor which accepts SVIDEO by seperate luma and
chroma input. This means a special adapter to your atari (5pin DIN)
which is easy to produce and a cable with RCA or SVIDEO mini-jack. But
such a monitor is not a SVGA compatible!

The best solution might be a RGB converter which accepts seperate RCA
luma/chroma. But I'm not sure, that such a device exists.

I ran the second ground on the Atari to the sheilding on the DB9 connector. It's still a bit unstable, and at one point, I got a blue screen of death. First time that's ever happened on my XP machine :-) I don't take that as a good sign. Should I put a resister inline on the ground?

That reminds me, stock 800XL's do not have the Chroma line connected, so to use the S-Video, you would have to do at least a minor upgrade, or you are "stuck" with composite video.
As far as video developed in 1984, remember that the 800 was developed ~1979 and the display was arguably the best Atari ever produced.

really? I've never seen a working Atari 800 screen.

But I heard about this supervideo upgrade. What does it mean? Simply
upgrade an stock XL to SVideo or upgrade/patch the bad picture on
every xl/xe with SVIDEO?

hmm. Well, well.

My problem is: I can't format a disk with DOS Filesystem. No Ramdisk
no virtual drive. This problem only appears in my favourite spartados
(V3.3) .... using BeweDos I can format a disk using the "MENU"
program. Which is very usefull!

The 19Sector ATR is a little "ATR compiled binary" which is bootable.
But in this format I'm unable to test it in my SpartaDos enviroment.

My goal is the following: set up a virtual ramdrive (no ramdisk) by
QMEG4.0. Format it with DOS filesystem. Copy some files to it and boot
this ramdrive.

The thing what is missing: the AINIT within SpartaDos.

Check out the Super VIdeo Upgrade (and others) at:
http://www.geocities.com/atarimods/

I'm not positive that I understand your question, but...
The Super Video upgrade will improve the picture on any stock 800XL (even if you are using composite output).

S-Video will improve the display versus composite 99% of the time.

Together, things are really good, especially on a VGA display.

These are extremely rare in the US and should fetch a good price.
Maybe $50 for Des Chiffres. Not sure about the French Atariwriter -
often there is less interest in non-games.

You might have more luck in alt.games.lynx or rec.games.video.atari.
c.s.a.8 is focused on the 8-bit computers.

Good luck!

AINIT was removed appearently in all 3.x and above Spartas, you will have to go back to 2.x to find it. But it wouldn't do what you want even if you did have it. It won't boot! It only formats a disk with Atari type 2 VTOC and directory sectors. The three boot sectors are completely dependent upon the particular type 2 AtariDOS that does do a successfull booting(able) format. AINIT would leave the three boot sectors blank, unless I miss my guess.

What any Sparta will do for you is to read those Atari type 2 disks and write those files to a Sparta formatted disk and visa versa, if you can use that technique for anything. I've found it best to use Sparta's file copy utility XCOPY for that, it seems to result in the least amount of error's.

Your bootable "ATR compiled binary" should boot no matter what the DOS?? Maybe not...I don't know anything about such a thing. Perhaps you just need to use Sparta's boot jump address to point to your file? I disremember the exact location in the first boot sector, but when you have more than one SpartaDOS on the same disk, the one you want to boot must be set with the 'BOOT' command. Which actually only sets two bytes in the first sector to the sector number of the particular Sparta that you want to boot that disk with. See the SpartaDOS Construction Set Manual for that location - BeWeDos should be the same, but I can't guarentee that.

Best selling cart game (of the games I have) are :

Rescue on Fractalus,Ballblazer,Blue Max,Necromancer,Pengo,Moon Patrol
and Battlezone,Airball and maybe Archon.

Games like Gato,Thunderfox,One on One or Crossbow did never sell very
well.

Games with very high bids on ebay (but I usually doni¿½t have them) are
:

M.U.L.E. (very expensive)
rpgs like Ultima 1-4,Alternate Reality 1+2 ...
Infocom Adventure or Magnetic Scrolls Stuff
Lucasfilm Games like Rescue,Ballblazer,Koronis Rift,Eidolon
Activision games
etc.

Most of the reals classics sell well,but newer , cassette games are
not wanted.
Simulations and sports games are not as valuable.

I think the best classic game for a cart version would be MULE.But
iti¿½s an EA game and I would never get a licence for this one.

If you program a rpg/convert a C64 or arcade classic or do something
special,like this "Vector" - a 3D First Person Shooter , I think you
would get money for it.

It seems that nobody is interested in sports games or simulations , I
think most collectors like classic arcade games , classic rpgs ,
classic computer games or something with really awesome
graphics/sound.

Source record: 27948

I can't seem to edit the standard keyboard template (default.a8k) in Atari800WinPlus 3.0.

I start with the default template and select the 'edit' button. From here I change the PC ESC -> Atari ESC mapping to PC ` -> Atari ESC. (I need to remap the ctrl + shift + esc sequence since this brings up the task mgr in Win2000 and it is also used in the emulator to 'flash' DDT)

I save this and then return back to edit of the new template, now called ddt.a8k and I see the original mapping, not the new one. Restarting the emulator doesn't help.

help.

It's possible that it's XP, but I doubt it. Once I get my desktop up and running, I can use that as a comparison, but I'm almost positive it's either a grounding issue (most likely, I think, since another laptop user experienced almost identical issues), or it's a problem with my USB to Serial setup.

If it works with the desktop, then I'll try a PCMCIA serial adapter. Maybe that will have better luck.

The desktop doesn't really cut the mustard for me because it's very inconvenient, where it's located.

I started playing Ultima III today to start getting an idea of what appealed to me so much about it. I have to admit, it's still very compelling, and I'm taking notes on the things that are compelling about it.

I think doing a game along those lines may be the way to go.

Thanks for the info. That's really helpful.

Larry,
Why would you want to? The DCM and ATR are representations of Atari drives, meant to reside on a PC. To access an ATR on an Atari, you'd either have to transfer it to a floppy (on which it may not fit), or put it inside of another ATR, which would start getting confusing.

In answer to your queston, no, I'm not aware of any Atari programs for accessing these.

It would be easy to do, but the need has never existed for me. I wrote one to go the other way making a floppy from an .ATR on the A8. You would need media greater than 92K to receive it; something like DD or Enhanced or a hard drive. I make .DCMs on the A8 and transfer to the PC for conversion to .ATRs.

I guess your problem is either related to your system setup (maybe
including WinXP) and/or to the USB adapter:

The SIO protocol is somewhat timing critical, and therefore even a very
short interruption can cause the transmission to fail.

After receiving the command frame the PC has 16 msec time to send an ACK
and then process the command. Although the Atari retries to send the
command frame some 10 or 15 times if it doesn't receive an answer in
time, you can run into several nasty problems:

Consider the case when the PC responds just a little bit too late and
the Atari restarts the transmission of the command frame while the
PC is already processing it. The Atari will possibly miss the
response, and the PC could possibly read the command frame as data
bytes - and both will get out of sync.

It is highly implementation dependent how such error situations are
handeled by the SIO server. I don't know how SIO2PC / APE / Atari810
do it, but the symptoms you described (working some of the time, but
not reliable) indicate some critical timing.

So, what could be the causes of your problems?

* The USB-serial adapter has to encapsulate status and data information
into packets and transmit it over the USB. If something goes wrong
while transmitting the packet, it will be re-transmitted, introducing
some additional delay.

Even if the packet is transmitted successfully in the first attempt,
the encapsulation, USB protocol handling, and de-encapsulation by
the driver takes some time.

* Your system could be reacting too slow, which can have many causes:

It could be the Windows kernel, for example accessing the harddisks and therefore blocking other processes or interrupts. Be sure your harddisk(s) run in DMA mode and if you've got the possibility, try deactivating multi-sector transfers.

It could also be some windows driver or other processes stealing processor time. Try disabling everything that runs in the Background. Also try disabling all drivers you don't really need for running the SIO server (eg sound, modem, network, power management, ...).

I'm currently working on an SIO server for linux and while developing the software, I ran into several timing-related issues - very similar to the problems you described. The software is still far away from being finished, but some first tests worked quite well: on my testing machine (a 486SX/33 laptop with 8MB RAM) it did run smoothly, even at high speed (57600 bit/sec) SIO - but only when no other CPU-intensive processes were running. A "find /" on another terminal was OK, but eg. logging in or starting a new process caused timeouts. I've already got some ideas how to solve this issues (-> realtime scheduling), so I'll proceed with testing :-)

Anyway, I'll post an announcement when my software has reached alpha state.

so long,

Hias

I'm pretty sure it's not a timing issue. There are a few reasons:

1: I'm running a 1.7ghz P4.
2: CPU usage is around 0-1%. I've got nothing running in the background.
3: The Atari makes some kind of nasty noises when it's unable to read the sectors. I think this has to do with the signal being noisy. I think the noise comes from the Atari because the Pokey chip is used for both sound and the SIO port (this is correct, isn't it?)

It might work fine for a few sectors and then the sound gets messy and I start getting boot errors.

Seriously, what do you think ? I know, it really has nothing to do
with the operating system I'm working on, but I thought it'd be a
great way to advertise my website. All it does is advertise my
website using screen shots of classic games & computer systems.
Considering the tool I've used, I don't think I can sell it, wouldn't
want to anyways since rtdos itself is going to be & will always be
free.

main page:
http://geocities.com/rtdos

link to screen saver (zipped):

Hello,

Although I have owned an Atari 1200XL since the mid-1990s, I haven't used it much and I would like to start programming on it. I've flipped through the manual which game with the machine, as well as the Atari BASIC manual, and I have a few questions:

1) I want to convert a few of my Commodore 64/128 text adventures writeen in BASIC to the Atari format. However, arrays are handled differently on the Atari, particularly subscripted variables/arrays. How do I rework these to work on the Atari?

2) How do I get multiple colors on screen at once, just for the text? The background can be changed, and that's fine, but the text is always the same color. This isn't what I'm looking for!

Any ideas?

E-mail me at: dunric@yahoo.com

Regards,

Paul Panks
dunric@yahoo.com

Atari strings are simply character arrays. You MUST dimension them
before you use them:

Atari BASIC Other BASICS

10 DIM A$(10) 10 DIM A$(2)
20 A$="HELLO" 20 A$(0)="HELLO"
30 PRINT A$(3) 30 A$(1)="GOODBYE"
40 PRINT A$(1)

results in: results in:

LLO GOODBYE

Doing arrays of strings in plain BASIC can be a big pain in the butt.

In the past, I've done such unclever things as assuming all strings
were, say, max. 15 characters, and I had 10 of those strings:

10 DIM STRING_ARRAY$(150)
15 DIM STRING_ARRAY_LENS(10)

Then just grabbed parts of this large string and pretended they were
their own strings.

Ugly. :^P

Of course, Atari BASIC can theoretically have a string as large as ~32Kbytes!
Let's see C=64 BASIC do _that!_ ;)

> 2) How do I get multiple colors on screen at once, just for the text?
> The background can be changed, and that's fine, but the text is always
> the same color. This isn't what I'm looking for!

You can use GRAPHICS 12 mode, and PRINT #6 text onto it.

Or, for better ease-of-use, just stick to GRAPHICS 0 mode, and rewrite
the screen's Display List so that all of the lines are in '12' mode.
(It's a so-called 'IRG' graphics mode)

That'll get you SOME color. The bits in the character set (font) come out
like so:

00 - 'Background' color (SETCOLOR 4 ; aka POKE 712)
01 - Color 1 (SETCOLOR 0 ; aka POKE 708)
10 - Color 2 (SETCOLOR 1 ; aka POKE 709)
11 - Color 3 (SETCOLOR 2 ; aka POKE 710 - in normal video
SETCOLOR 3 ; aka POKE 711 - if char is inverse)

So if the font were purely "00" and "11"'s, something like this:

00000000
00110000 ##
11001100 which would look like this on the screen: ## ##
11001100 ## ##
11111100 ####
11001100 ## ##
11001100 ## ##
00000000

If you set Color 2 to blue, and color 3 to red, you could do this:

```
----------------
PRINT "THIS IS BLUE. AND THIS IS RED."
----------------
^--- my poor attempt at showing 'inverse'
```

The characters don't APPEAR inverse. Just the blue looks red. ;)

Whew!

-bill!

it is not CPU but USB/serial communication we are talking about

>3: The Atari makes some kind of nasty noises when it's unable to read the
>sectors. I think this has to do with the signal being noisy. I think the
>noise comes from the Atari because the Pokey chip is used for both sound and
>the SIO port (this is correct, isn't it?)

I do not quite understand what are you talkng about here - the usual beeping
associated with reading the floppy is entirely optional and also the other
noise produced by Atari when it tries unsaccessfuly to access floppy is
produced programatically - they have nothing to do with actual data
transmission. So unless you are talking about something else you cant judge
the signal (noisy? what do you mean by that) by the sound your Atari is
producing.

Anyway, you would really save yourself a good deal of time if you could run
this machine in pure DOS environment with DOS version of APE or SIO2PC.

First of all, while you may find my answers to Matthias's question irrelevant, he asked, I answered. He suggested something could be running in the background causing CPU usage to be too high for APE to respond in a timely manner. I was indicating that I had a fast machine and close to 0% CPU usage. Sorry you find that irrelevant, obviously Matthias doesn't.

I'm not aware of what produces the sound of the sectors. You say it's coded in the OS, okay, that may be. Either way, the normal sound of the sectors being read changes to an irregular, distorted sound. I was trying to convey that. I read something about SIO being handled through pokey, so I made an assumption.

As for testing under DOS, that's not possible. I don't have DOS drivers for my USB adapter and the vendor doesn't make DOS drivers for it.

I'm trying to work with what I have available.

Let's start with some facts:
The USB adapter works with other serial applications (I've tested it with a modem and I've used it connect to the serial bus of a Linux machine as a terminal).

So, given that these apps work, it's reasonable to assume the adaptor and Windows XP work with fairly normal serial apps.

While the SIO2PC cable may work with DOS, that's great. I don't work with DOS and I'm not willing to run my laptop under DOS.

I finally tested the cable under a Win2K machine with a regular serial port and it works fine. Unfortunately, that's two changed variables: OS and serial port. Unfortunately, I don't have another XP machine to test under, but I'm guessing there's not much of a difference in how the serial port is handled between XP and 2K.

So, given these facts and assumptions, I think it's reasonable to assume that the issue is either a grounding issue, or maybe as Matthias mentioned, a timing issue.

Pete

> I want to convert a few of my Commodore 64/128 text adventures > writeen in BASIC to the Atari format. <

I can't add much to Bill's excellent answer to your question, but if you are willing to invest a few $ in your project, you can buy an (Atari) Microsoft Basic Cartridge (ATMSB) that will make your conversion much easier. I have converted several Basic programs from the 64 using this route, and it has worked well for me.

If you try this, ATMSB I was a copy-protected disk, while ATMSB II was a 16K cart + disk extensions. Functionally they are the same, but the cart is considered the better route. I have seen these go on eBay in the $5-10 range, and if you search a bit, you probably can do better than that.

Be aware, though -- ATMSB is a BIG Basic with many features that take a lot of memory, so the Atari may not have enough memory for long programs unless you do some tricks like chaining, etc.

There are other Basic's for the Atari that would work. These other options have advantages and disadvantages compared to Atari 8K Basic and ATMSB.
Good Luck!
Larry

That was a good post Bill made, there is another way to do this though. You could define your own character set. A little complicated, but the results are awesome. I have a game program that demonstrates how to do this. It's an old cassette based graphic adventure that I converted to ATR disk. If you want a copy let me know and I'll email it to you.

That nasty "noise" that you hear on the SIO is caused by errors on the buss.
Power on your system with nothing plugged into the SIO and you will hear the
OS polling for D1:.
Power on with D1: available and you will hear data being read over the buss.
Plug a P:R Connection into an unmodified 1200XL and you will get a short
burst of buss errors....
You are probably hearing buss errors.

Instead, look for the Super Archiver upgrade. It will do fuzzy
sectors so you can copy those A/R City and Dungeon disks you so
desperately need to back up. :)

Look at www.myatari.com for details.

It's amazing how much I remember for how little I use it lately
(pretty much: none, unfortunately).

Of course, I DID use it regularly from 1982 or 1983 until about 1998.
Yikes! :) (Thank goodness I had Action! for the latter part of that)

I understood j131's answer in such a way, that he was stating that
the CPU-speed is irrelevant - which is basically correct for most
modern computers of the last 10 years or so.

> I answered. He suggested something could be running in
> the background causing CPU usage to be too high for APE to respond in a

> CPU usage.

Well, the critical thing is latency - not execution speed. And these two
things are (almost) unrelated. Latency depends more on the operating
system and other hardware - while CPU power actually doesn't really
matter for SIO servers.

You don't have to do complex calculations when pretending to be a 1050,
the important point is that you interrupt anything you are doing at
the moment, as soon as the Atari asks for a sector. And the Atari is
really critical with you, when you aren't fast enough! :-)

> Either way, the normal sound of the sectors
> being read changes to an irregular, distorted sound. I was trying to convey
> that. I read something about SIO being handled through pokey, so I made an

This really sounds like timing-errors.

I really suspect the USB/serial adapter (or it's driver) to be the
cause of your problems. If you've got another machine with an USB port,
you could try using your adapter there.

Besides that, I don't have any more ideas at the moment...

so long & good luck,

Hias

Hello Matthias,

I kind of suspected that timing errors were involved. That's why I questioned whether Windows XP was at fault, since anything NT-based does strange things with the timing of midi data, for example. But then Pete told me that he got good results with Windows 2000. So, like you, I now suspect the USB/serial device and/or its supporting software.

Take care.

Alan

4260. Re: Text Adventures on the Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-30 00:40:45 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <hazb9.6794$%D6.600833@newsread1.prod.itd.earthlink.net>
Source record: 27982

Multi-colors in the large text modes are as simple as inverse and lower case
in the print statements. There are 4 color registers for text in Graphics 1
and 2 controlled by locations 708-711. Experiment with upper and lower case
in both normal and inverse video to put characters on screen in split screen
text window mode; Pokes of hue plus 16 times luminance is easier for me than
determining which Setcolor combination does what.

The string arrays are only slightly more involved to simulate using Atari's
linear strings with a little planning and a little math. Your array elements
must be organized into a single Dimensioned uniformly spaced string based on
size of longest element. e.g.

```
DIM TEMP$(20) any sufficient size
DIM WEAPON$(40) 5 ea at 8 for longest

WEAPON$=" ":WEAPON$(40)=" ":WEAPON$(2)=WEAPON$ clear $ memory

RESTORE 9000:FOR L=0 TO 4
READ TEMP$:WEAPON$(L*8+1)=TEMP$
String positions always begin at one rather than zero; single subscript
selects referenced position to end; double selects from 1st to 2nd.
NEXT L

9000 DATA ax, revolver, knife, mace, spear

Resulting WEAPON$ will be:
"ax revolverknife mace spear "
The equivalent of WEAPON$(3) can be extracted with:
L=3:TEMP$=WEAPON$(L*8+1,(L+1)*8) selects 25 thru 32

I concur. I was hoping on doing a write up on it, just haven't had
the time. I have browsed the CD and played around with a lot of the stuff
on it.

For $15, I don't see how you couldn't justify buying it!

I've started working on one. :) So far, only in BASIC, so it's slow,
but I'll see if I can get it going in Action!. (My biggest problem right
now is lack of reliable SIO2PC/APE access to my Linux box. >:^(
I don't have MSDOS anymore, and never installed Windows, so I'm stuck with
what little is available to use my SIO2PC cable with...)

I ran "xmatrix" screen saver (for Unix/Linux) and attempted to 'duplicate'
the font in 4x8 pixels, 3-4 colors. I'll be using IRG mode (Graphics 12)
and this font.

I'll set two green colors (a medium brightness one, for the bulk of the
pixels on the screen, and a darker one for any 'antialiasing'), and
a bright white color (for the characters that just pop up on the screen).

It won't be PERFECT, but it should end up being a pretty good replica! ;)

-bill!
(hmm.. maybe I can find Action! to run under an emulator...)

While Action! "works" under Atari800Win, it won't load or save. I reported it to Paul Irvine, who passed it on to the authors and expect it will get fixed. Other than that, Action! seems to work fine, from my tests.

I actually tried to fix the problem myself, but I couldn't get it to reliably stop on my breakpoint. It stopped on it for a while and then suddenly started skipping it and wouldn't ever hit it again, even after reboots. Weird.

Source record: 27987

Hi, Larry;
Lets assume you have a DD drive or large Ramdisk since any .ATR will not fit on a SD floppy. We can create the Basic program with a few USR(calls if the usage would justify the time and effort of the coding. The two tricky bits are:

1)Density
The .ATR header, sector size and number of sectors vary among the several densities which will effect the algorythm parameters. Auto density selection is another complicating factor; Justin Wilder's DiskMend used a status inquiry which was very effective on a Doubled 1050, but somewhat unreliable on a Percom. It would actually be simpler to have separate programs for SSSD, SSED, SSDD, DSSD, and DSDD than tackle the complexity of a single universal program. Will MyDos allow you to configure an XF551 as double sided and then format in enhanced density..?

2)Disk Swapping
More code is also required for prompts and density changes on a single drive. The simplicity and speed of coding encouraged me to design my ATR2DISK for two drives or one and a RamDisk so I could do all of the settings and let it go on its own. It still has not progressed much beyond a user-unfriendly quick and dirty utility for my own use.

I do not believe it is possible to have more than 5 real players. In fact
there are only 4 players, though a 5th is often faked using the missiles.
Routines that have more than 5 players are either:
i) Repositioning the players (horizontally) during screen draw.
ii) Using software sprites (i.e. moving screen memory around with the CPU).

BTW PMGs are done in hardware. So not handled by an OS routine. I don't
think the OS uses them at all, though I may be mistaken?

(How) can I connect an (old) Philips 8852 color monitor to my 800XL?

I can get one for free (from an MSX system, including the NMS8250 system BTW), but I only want it if I know I can use it.

Is there anyone in this group from the Netherlands who knows where to get the right cable?

TIA,

Richard Douwes

4274. A possible 'cut-down' version of my Atari 8-bit CD-ROM for German-speaking countries

Newsgroup: comp.sys.atari.8bit
Date: 2002-08-31 07:35:51 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1030779488.22470.0@dyke.uk.clara.net>
Source record: 27994

Hello All,

As you all probably know, I am unable to sell my Atari 8-bit CD-ROM of PPP/DGS products to German speaking countries (Germany, Austria, Switzerland) because my PPP license doesn't cover these countries. However, this restriction only covers the PPP products, not the other products on the CD. Would there be any interest in a special version of the CD which would only contain Digi-Studio, and all 26 issues of my old News-Disk/Paper magazine? Naturally, the cost would be less. The problem is that the CD obviously costs the same to produce and ship regardless of what it contains, so many of the costs of production can't be reduced. If this CD was only shipped to the 3 countries listed above, the shipping costs would be lower which would help reduce the cost. Payments would still be quoted in US$ and accepted by PayPal. I'm thinking in the region of $8-$9 including shipping to Germany, Austria, or Switzerland only. Of course, if anyone outside of these countries wanted to buy it, then that could be arranged also but at a slightly higher cost (let's say about $10 if it shipped to the US). If anyone would be interested in this, then please e-mail me. If there is some interest, I'll arrange to have a new PayPal order button for it on my site, and I'll post another message if/when this is done.

Of course, the full PPP/DGS version will still be available for $15 including shipping. Visit http://www.dgs.clara.net and click the on the CD-ROM link for more info and to order by credit card.

Hey Richard,

I guess this should work. I have also a Philips Color monitor (normally used with MSX)... You should ask if the monitor has a VIDEO-Composite input, or SCART connector. If it has one of these, you can connect your atari 8bit.

By the way the cable pinout is easy to do you yourself.
If you know more about the monitor I can provide you the info for your cable.

Bye,
Marius

4276. NO SHARP screen on OLD XL's

Newsgroup: comp.sys.atari.8bit

From: Marius & Hester <grover25@zonnet.nl>
Message-ID: <akqcu9$l9b$1@reader12.wxs.nl>
Source record: 27996

Hi!

This is a known problem on the older XL computers. The screen is not sharp but soft. There are a few modifications to fix this problem. One of the easiest ways to do it was to de-solder a capacitor (as far as i remember).

Where can I find the info about this modification. I have to fix 2 600Xl's this way, but I don't know anymore HOW.

Please Help.
Thanks
Marius

It has a SCART connector and a "TTL/RGB" connector (8 pins, 1 in in the
center, and 7 around it). If you can give me more info on how to connect it
to my 800XL, I'd be very grateful!

Hi All,

It's been a long time since I posted a message about 6502.org, so I thought I'd remind the groups and introduce the site to anyone who is not familiar with it.

6502.org is a resource for anything to do with the 6502 microprocessor and its relatives. The site is not geared towards any specific platform. All of the information presented on the site can be applied to any 6502-based machine. We support users of classic systems, homebuilders, and also embedded applications.

Some of the things offered on the 6502.org website are datasheets for the 65xx parts, snippits of generic 6502 source code, hardware projects, tools, and links to all things 6502.

For years we've had a very active forum hosted on DelphiForums with some great discussions about hardware and programming. We've just recently switched over and our forum is now right on the website. This is a great time to get involved because the discussions are just starting back up as we move from DelphiForms. http://www.6502.org/forum

I'd like to encourage anyone interested in the 6502 microprocessor to visit the site. Also, I'm actively seeking more material (code, projects, etc.) to add to the site. If you have some 6502-related tidbit that belongs on the site then please e-mail me.

Best Regards,
Mike Naberezny

The XF551 is a true double-density drive whereas the 1050 is only "enhanced"
or "dual" density.

The 1050 supports up to 128K disks. I think the XF551 may be double sided,
giving it a full 360K.

There are other true double-density drives available for the Atari,
including the Indus GT, the Rana, Percom, and others. The XF551s I've seen
on e-bay were pretty pricey, but I got a great deal on a Percom the other
day.

Hi,

You are all invited to design a logo for the Atari Preservation
Project. The best logo will be choosen by the members of the APP egroup at
yahoo and visitors of the German ABBUC Atari 8-bit meeting (JHV 2002).

The winner gets a T-shirt with the Atari logo on it! :-)

The deadline of this competition is 15 october 2002. After that, the voting
starts. The last votes are collected on the ABBUC JHV.

More info about the project can be found here:
http://www.abbuc.de/app/index.html
Please take a look at the 'Project' and 'Software' sections. Note that the
web-pages need more work, but the basic info is there.

Please send your logos to me. Good luck!

Freddy.

Hi Tom-
> ATOS has a Matrix screen saver. It also works in "stand alone" mode. <
http://cth.dtdns.net/matrix.com

For some reason, all I can get is the contents of the file on the PC screen.
Is this somewhere in the CTH archive that I can access as a regular FTP? I
looked around a little, but couldn't find any "Matrix" except the ACTION! game.
I use IE 6.x with Win XP and it usually doesn't have this type of problem, but
does this time. Also tried "GetRight" but also without success.
Thanks,
Larry

No, the Atari disk drive contains a floppy disk controller and a
microprocessor to communicate with the Atari serial bus. With the SIO2PC
software and cable, you can use a PC (the whole computer, not just the
floppy drive) as an Atari disk drive.

Hi Marius, first is your assembly just a single file?
If so try breaking it up into more managable files, maybe 4-8k per file or into component macros and write a short batch file to include all your files.

Also i seem to remember that labels must be no longer than 8 character in length so any variables, macros and branch labels that greater than 8 characters will be trunicated to the first 8 characters, thus the first label called gets allocated and all other labels with the same as those first 8 characters will be treated as duplicates or in the case of branches may be out-of-range-error!

I had the same problem with Konqueror on my Linux box.
I simply copied the URL and then opened a Terminal and typed "wget [PASTE]" :)

One lame thing you could do to get around it is to make a simple HTML page:

matrix.com

and then open that HTML file in IE and right-click the link and say
"Save As..." or whatever IE provides (if it does... man that browser's
a piece of crap >:^P)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi,

I totally agree... the complete MNX crew was impressed this time with all those people. The meeting was just fine... only to short... I did like to stay for a few weeks more...

Hi,

I think you reached the limit of the diskversion. Strange things will happen
when working with large code...

The cartridge can hold over 30Kb and can do just fine, but the cartridge has
a problem with some memory area's I think because of the DDT and so...
For editing and assembling the cartridge run's great....

Yep,
Power per Post had the right for Germany, Austria and Switzerland. These rights were sold to PD-world-Versand / Sascha Roeber. so Sascha is the copyright holder for these countries today (allthough I am quite sure he does not sell much to Austria and Switzerland). Here in Germany he produces the Atari magazin (or New Generation Atari magazin - a paper mag in german language) and the PD-magazine (a disk mag, also german language). And of course he has a big catalogue of software and hardware products (all PPP rights, some KE-soft rights, etc.). His adress is: Sascha Roeber, Bruch 101, 49635 Badbergen, Germany; He visits the ABBUC JHV every year and since he always requires 4 or more tables you cannot oversee him...
-Andreas.

>

Well, this is surely untrue. collectors pay much money for old games.
But they do not pay much money for brandnew games (except if they are
limited!) My intention is/was to burn some PD games onto cart, for
example some Oliver Cyranka and Frank T.Wittenmayer games as well as
other games from Antic, Analog and other PD sources. Normally I do this
for my own/private collection. but I am currently thinking about
producing some cart games for commercial release. Don`t know yet, when
this will be done, since I am working together on this project with Nir
Dary who lives in Israel. Next, I do not have any 48k or NTSC Ataris, so
Nir also has to test them on US machines for me.

The main problem is, that we have lots of XEGS carts, but XEGS carts
cannot be turned off!! And lots of games use the 8000-BFFF area, thus
they will not work from XEGS carts unless they can be turned off
somehow. So we are thinking about two things now: a) produce carts /
Pcb`s that can be turned off (like Atrax/Video 61/Williams or other

carts) which will be expensive or b) patch/upgrade the XEGS carts in such a way, they can be turned off which will be time consuming (testing...). Well, just wait and see what happens... -Andreas magenheimer

Source record: 27921

Well,
the same answer again: use MENU.COM from Sparta or Bewe DOs to do so.
both versions have more commands than those that are visible instantly.
use Control + cursor left/right to scroll through all available options.
You can also type "A" or Control+A to get to the Ainit option instantly.
Once there type return key. You will be asked about the format (at last
in Bewe DOS), make your choice and press return again. The disk should
then be formatted in Atari DOS format...
-Andreas.

Thomas Havemeister schrieb:

Well,
read my Ramdisk info texts to find out which programs support or require extra RAM / Ramdisk. These texts can also be found in the Atari FAQ by Michael Current. I will post the new updated texts in a few minutes. Of course not every program supports 1MB Ramdisks, some only support 48k or 64k and even Ramdisk programs are limited to a certain maximum (128k, 192k, 256k, 320k, 576k,...). Next there is the compatibility issue (most programs merely support one Ramdisk type and don`t care about others). Anyway, have fun with your 1088k computer. -Andreas.

Well,
if you need the Atari DOS 2.x format, why not use Bibo-DOs, turbo-DOs or other DOs 2 compatibles then ?!? As you may know, SpartaDOs 3.3 was made for BBS (Bobterm, Express Pro and such) and may not work correct with a normal Atari system (without BBS/modem/Express Pro) connected to a disk drive. When I used Sparta 3.3 on my system with a disk drive (and without BBS) I got dozens of errors and problems which were not there in versions 3.2... -Andreas.

4303. Re: Atari ATR Basic Program

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-02 15:14:21 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D73804D.6911792E@students.uni-mainz.de>
Source record: 27924

Well,
I have a turbo-Basic program to convert an Atari disk into ATR format.
sorry, no Action program, no standard (Atari) Basic program. but maybe
this turbo-basic utility is better than nothing. For the other way
around (convert ATR or XFd into Atari disk) I do have many more
programs... -Andreas.

P.S.: To convert DCM into ATR (completely filled single, medium/enhanced
or double density disks) one would require quite some extra RAM /
Ramdisk. At the moment such a program does not exist for the Atari...

LLpwhite schrieb:
>

4304. Re: Atari ATR Basic Program

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-02 15:18:18 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D73813A.CD22FD0D@students.uni-mainz.de>
Source record: 27925

Well,
you can use Ataridsk, Util, Myutil and other programs to download files
from the PC to the Atari. This way you can also download ATR or XFd
files to extract them later on the little Atari. For the Atari there are
already some programs available for this purpose, like ATR-Convert
(ATR=>A8 disk) by Tom Hunt, Unimage by ??? (polish *.CTB file),
Diskformer (XFD=>A8 disk) and other programs.
-Andreas.

4307. Atari Ramdisk info list... Version 1.9

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-02 15:46:49 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D7387E9.75061B70@students.uni-mainz.de>
Source record: 27928

Well,
as every month, here is this (updated) list again. The following things
have been updated:

- added info about 576k XL (info from Guy Ferrante);
- added info about Satantronic`s 1MB PC-SIMM Ramdisk (info from XI of
Satantronic);
- limited the textlines to 76 chars per line (as requested by Michael
Current);

3.7 Atari Ramdisks - the first try of an (incomplete) Overview:
[This is version 1.9 from September 2002]

Right from the start of the Atari 8-bit computer era in the late 70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM
extensions and enhancements, just to save some money. Also a lot of
firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to see
this text & info growing. For now let us start here, the info-section
is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);

8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

3.7.1 Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k
RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible,

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks normally do not homebank when RESET is pressed (a fix should be available somewhere), whereas original Axlon Ramdisks do homebank properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that enhances the memory of your Atari 800; avaiable in 3 sizes: 16k, 32k and 64k (where max. 52k can be utilized from 64k). Looks like these are no Ramdisks, just (normal/main) RAM enhancements. But maybe the 64k Ramboard can be patched in some way to gain a small 16k or

32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

3.7.2 Atari XL/XE Ramdisks:

Due to an excellent article by John Picken, I`d like to present the
following overview first (found this info at Jindroush`s homepage):

RAM BANK ACCESS TABLE 64-1024K

PORTB Available on Type

E3,E7,EB,EF 1,2,3,4,5,6,7,8,9
C3,C7,CB,CF 2,3,4,5,6,7,8,9
A3,A7,AB,AF 2, 4,5,6,7
83,87,8B,8F 3,4,5,6,7
E1,E5,E9,ED 5,6,7
C1,C5,C9,CD 5,6,7 (short
A1,A5,A9,AD 5,6,7,8 overview)
81,85,89,8D 5,6,7,8
63,67,6B,6F 6,7
43,47,4B,4F 6,7
23,27,2B,2F 6,7

Type Upgrade Mapping
1 = 130 XE
2 = 256 XL Bucholz/Peterson/Rambo
3 = 256 XL Newell
4 = 320 XE Peterson
5 = 576 XE "
6 = 832 XE "
7 = 1088 XE "
8 = 832k+ " (BASIC on)
9 = 576 XE " " "

Note 1: The documentation by Scott Peterson on his upgrades indicates
that only 128k is available in XE-compatible mode (Types 8/9 above). Two
more 64k blocks are available as indicated with 832 or 1088k machines
though not all RD handlers will find and use them.

Note 2: Based on an article by Jeff McWilliams in the April 1993 edition
of AC, it appears the Newell 1-meg upgrade is mapped similarly to the
Peterson.

Note 3: With version 2.1 of the SpartaDOS Wedge, Ed Bachman describes a
simple fix for Peterson upgrades to reenable Antic access to extended

RAM. It is definitely worth checking out, even if you don't use
SpartaDOS.

Again thanks to John Picken for this information.
Now let`s continue with my own overview table (long overview):

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not
reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard
convention
as the majority of ramdisk users don't want bit 4 counted as a control
bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the
'on'
bit for ANTIC's access to the extended memory for 'compatible' (to
130XE)
machines as well. If bit 5 does show up in a bit use table, one can
only
assume that this is an incompatible machine which doesn't have or use
ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XEs made in China have faulty GTIAs => replace them!;
standard Atari ramdisk; Antic access: YES!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- 576k XL various authors 512k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3

2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS:Missile Command=YES!;
no use of any switches!; Antic access: YES!;

- Megaram 1 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David,
older Compyshop version; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Megaram 2 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 64kbyte Chips x4 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David,
newer Compyshop version; fully compatible to Megaram 1;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
Compyshop`s Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four (or more?) switches; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

=> Note that most (if not all) Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one "AND Gate" (refer to ABBUC magazine 63, page 19+20);

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: uses 64k as main RAM and 192k as Ramdisk/extra RAM;
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
built in Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80), if full 1MB is used,
then built-in Atari Basic is not avaiable; Antic access: YES!
built in Atari Basic: no!, XL/XE Selftest: YES!

- Newell Patch by E.P. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80), mod. by Erhard Puetz
(refer to ABBUC paper-magazine #29, pages 6 & 7), means:
full Basic and Selftest control; Antic access: ???
built in Atari Basic: YES!, XL/XE Selftest: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or
selfmade ones...) most likely do NOT have Antic access, due to
the lazyness of its creators or their intentions of simply not
needing it. In the past one argued, that there were no programs
available for that special case and there would surely never be

any program which really needs the separate Antic access. As we
all can see nowadays, this has turned out to be wrong. There are
at least two programs that use Antic access: 1) The Wedge 2.x by
Ed Bachmann and 2) Video Blitz by Helvetica Bold (maybe there are
even more programs, I do not know). These programs will not work
correct (The Wedge) or not at all (Video Blitz) if Antic access
is not available. Simply refer to Ed Bachman`s fine article (supplied
with the manual for The Wedge) on how to update/upgrade your Newell
or Peterson compatible RD for Antic access. However, original Newell
Ramdisks created and sold by Wes Newell do have the Antic access !!

- Newell Newell Ind. 4096k

E0,E1,E2,E3,E4,E5,E6,E7,E8,E9,EA,EB,EC,ED,EE,EF
F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
Notes: uses 8 pc. 4Mx1 Chips (511000-80); made by Newell, later by
FTE;
seems to be very incompatible to existing software and bankswitching
cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is
NOT available - only extra Ram/Ramdisk banks. With one PIA chip there
is simply no bit left to switch between main RAM and extra RAM /
Ramdisk;
But with the installation of a second PIA chip one would be able to do
so. Furthermore one may use (almost) any setup or banks he likes then
(with a second PIA chip one could control up to 256 Megabytes RAM...);
built in Atari Basic: no!, XL/XE Selftest: no (?); Antic access: no!;

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, RamboXL and newer Newell versions;
uses 64k as main RAM and 192k as Ramdisk; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

Notes: made in Poland; compatible to Newell & S.Peterson (?)
Atari Basic: no!, XL/XE Selftest: YES!, Antic access: no (?)

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, 600XL Ramdisks, Rambo XL (512k by
ICD), some more Compyshop Ramdisks as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

3.7.3 PBI-devices (XL=parallel Bus, XE=cart. Port+ECI):

Name Vendor Size Area
Banks Bits Port Note

- no information yet!
- missing info for the following Ramdisks:
ICD MIO (256k, 1024k), Yorky XL (256k), Turbo-Freezer XL (256k),
the Atari 1090 (this one should also have had a 64k extra RAM
expansion card), R.David/K.Peters Romdisk (512k) and many many

other PBI devices...

3.7.4 other "Ramdisk" types and devices:

Name Vendor Size Area
Banks Bits Port Note

- no information yet !!
- missing info for the following types and devices:
Flashrom (512k), Ramcart (64k-4096k) as presented in ABBUC magazine,
Rambox (64k-256k), CP/M card (with 64k extra RAM avaiable), ATR 8000
(also had 64k extra RAM), Turbo 65816 (or 65801 / 65802), ARGS Romdisk
cart. (64k) and many other types...

For this 9th edition special thanks go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl, Ron Hamilton, Wes
Newell, Guy Ferrante and XI of Satantronic for sharing their info with
me. Also thanks to John Picken for writing an excellent article about
ramdisks and cartridges (especially about bank-switching, which both
devices can do). And thanks to Jindrich Kubec (Jindroush) for presenting
this fine article on his homepage... Thank you Folks !!
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or
other things that might help, let me know. Please do also send
corrections
since there will always be some updates and corrections nescessary.
Atarian Greetings - Andreas Magenheimer.

4308. software supporting Ramdisk...

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-02 15:53:36 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D738980.50FD9329@students.uni-mainz.de>
Source record: 27929

Hello folks,
her is the updated list of software that supports a ramdisk. the
following updates have been made:

- used max. 76 chars per line as requested by Michael Current;
- added Inertia 2.9 and 4.5 (MOD-players) by MadTeam;
- moved some programs from 8.13 into this section 8.12;

8.12 Ramdisk-supporting Software:
(This is Version 1.9 from September 2002)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected
program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any
way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs...
Ok, enough said, let me begin:

8.12.1 DOS programs:

- Atari DOS 2.0 (selfmade RD drivers for Axlon and XE avaiable);
- Atari DOS 2.5 (driver for XE-RD and various selfmade drivers);
- MyDOS (supports Axlon and XE compatible Ramdisks up to 1MB);
- Sparta-DOS (supports XE compatible RDs and others up to 1MB);
- Happy DOS II+D (supports XE compatible Ramdisks up to 256k);
- BiboDOS (supports XE compatible RDs up to 256k);
- TurboDOS (supports XE comp. RDs, MIO, Irata, etc. up to 256k)
- TopDOS (supports XE comp. RDs and Axlon RDs);
- BeweDOS (supports XE comp. RDs and Rambox);
- SuperDOS (supports XE comp. RDs up to 256k)
- guess there are dozens of other DOS versions that support a RD...

8.12.2 non-DOS programs:

- Synfile (+) by Synapse supports Axlon-RDs;
- Syncalc (+) by Synapse supports Axlon-RDs;
- Synhome (+) by Synapse supports Axlon-RDs;
- other Synapse applications should also support Axlon-RDs;
- A.R.-The Dungeon by Datasoft supports 48k, 64k and 128k (XE-RD);
- Paperclip-II by Batteries Included supports 130XE-RDs;
- Atari-Writer-Plus by Atari supports 130XE-RDs;
- Atari-Writer-80 by Atari supports 130XE-RDs;
- A-Text or Austro-Text supports 130XE-RDs (only one of
these two programs, I am not sure which one);
- Page-Designer by XLent supports 130XE-RDs;
- Type-Setter by XLent supports 130XE-RDs;
- many other applications by XLent support 130XE-RDs;
- some 4bit-Sampler programs by Mirage/ANG support 64k and 128k,
some other programs also support 64k, 128k and 320k memory;
- The Brundles by KE-Soft supports 64k, 128k and 320k (CS) memory;
- Adalmar by Power per Post supports both 64k and 128k? memory (?)
- Megablast 1 by Thorsten Karwoth supports both 64k and 128k memory;
- Basic XE by OSS/ICD/FTE also supports 128k memory (some
statements like "extended" require extra RAM when used);
- Extended Atari Basic (PD) by ??? also supports 128k memory
(some statements like "Bank x" require extra RAM when used);
- Extended Turbo Basic (PD) by ??? also supports 128k or more memory
(some statements which choose a certain RD-bank need extra memory);
- the "Plus" versions of Textpro (e.g. Textpro 4.54+) support 128k
memory;
- Textpro 5.x has some built-in commands/macros which require extra RAM
when used (if you avoid using them a 48k/64k Atari is enough);
- Howfen DOS (1.x?), 2.x, 3.x and 4.x support 128k and more memory (but
also works well on a 48k or 64k Atari; however some tapes cannot be
copied on a small 48k machine); creates a menu with up to 20 entries;
not compatible to DOS 2,3,4 or Sparta/Bewe-DOS; Howfen and similar
images (like Multiboot, Alphaload, etc.) do not work on most
emulators!;
- Howfen Tape-to-Disk, the multi-stage C-D-Copy and C-Simulator supports
128k and more memory (thus you can copy a whole tape in one pass; if
you
merely have 48k or 64k you will need multiple passes and have to
append
each part to already existing parts; however some Tapes, with
mainparts
bigger than 40kbytes cannot be copied to disk on a "small" 48k
machine;)
this program creates "Bootdisks"; images do not work on most
emulators!;
- Fampy 2.3 (Bootdisk), a MD8 player by Friday-Software supports 128k
and
more memory; needs a minimum of 64k memory and supports many different
Ramdisks; does not like SpartaDOS format; works well with 90k, 130k,
180k and 360k disk densities (DOS 2.x format only);
- Fampy 6.1i+ (ML-File), a newer MD8 player by Friday Software supports

128k and more memory; needs a minimum of 64k memory and supports many
different Ramdisks; works well with 90k and 180k densities (DOS 2.x
formats), not so well with 130k (not DOS 2.5, not MyDOS, maybe
DOS II+D only?) and not at all with any higher density, nor Sparta
DOS;
- Midi-Player by Ireneusz Kuczek supports 128k or more memory (there is
a maximum of 300kbytes buffer space available for midi files);
- Midi-Recorder by Ireneusz Kuczek supports 128k or more memory (well,
the buffer space is unknown yet);
- Midi-Sequencer by Maciej Sygit supports 128k or more memory
(buffer space unknown);
- Midi-Pattern-Editor by Radek Sterba supports 128k or more memory
(buffer space unknown);
- MSC-IDE Interface software by M.Belitz and S.Birrmanns supports
128k or more memory (on 64k machines some programs will erase
and occupy the Ram area at 4000-7FFF);
- Diskcommunicator 2.x and 3.x by Robert "Bob" Puff support extra RAM
and/or Ramdisks of XE compatible machines (answer the questions with
"Y"es and your extra memory will be used as extra RAM, answer "N"o
and it will be useable as a Ramdisk -D8: or D9:- if available);
- Datei 4.x by ??? (author unknown) supports 64k, 128k and 320k (CS)
machines; this is a kind of Database...;
- The (Sparta-DOS) Browser by Tom Hunt supports all kinds of Sparta
DOS Ramdisks, just use your favourite Sparta RD-driver; it should
also work well on 64k machines (this is a filemanager program);
- Grafik+Sound demo by Peter Sabath exists in different versions, the
older one is for 64k machines, the newer one supports 64k and 128k
machines (with 128k the whole demo will run from the Ramdisk, with
64k the demo loads every part from the disk-drive);
- The Top 3 demo by WFMH runs on 64k machines, the "Veronika / dancing
girl" part also supports 128k machines (on 64k machines this part is
shorter and has less frames; on 128k machines this part is longer and
has more frames);
- The Muppet Movie by Madteam supports 64k and 128k machines (on 64k
machines all pics will be loaded from the disk-drive; on 128k Ataris
some pics will be loaded from the Ramdisk);
- Inertia 2.9 by MadTeam supports 64k, 128k and more memory;
- Inertia 4.5 by Madteam supports 64k (?), 128k and more memory;
- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means only 128k (for more extra Ram you have
to change the program, the DOS or the RD driver);
- 320k memory means any (?) XE-compatible RD with 64k RAM
plus 256k extra Ram / Ramdisk;

Thats all for now. Thanks to Russ Gilbert and Lee Barnes for sharing
some
info with me. Any further help or info is welcome !! Andreas

Magenheimer.

4309. Software that requires a Ramdisk...

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-02 16:00:35 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D738B23.A88B1346@students.uni-mainz.de>
Source record: 27930

Hello folks,
here is the new and updated list of software that requires a Ramdisk.
The following things have been updated:

- used max. 76 chars per line as requested by Michael Current;
- added Imperial Demo by Innovative;
- added Numen Demo by Taquart (the new version now works alright
with CS type ramdisks);
- removed some programs here and moved them into 8.12 software that
supports a ramdisk;
- updated info about Koenigsdiamanten and Cavepack (there is not only
a 128k version; a 64k version also exists);

8.13 Atari programs which require extra Ram / Ramdisk:
(This is version 1.9 from September 2002)

The memory values given are not always fully correct, since I do not
have all kinds of memory settings or Ramdisk types. At the moment I
merely have machines with 64k, 128k and 320k memory. Thus I cannot
tell if a program may work with 192k or 256k (or more than 320k), since
I do not have such machines. Any help or correction is welcome...

8.13.1 non-Demo programs:

- Koenigsdiamanten by KE-Soft (PD) exists as a 800XL and a
130XE version, the XE version requires 128k memory;
- Cavepack (Pacman as H.E.R.O.) by KE-Soft exists as a 800XL
and a 130XE version, the XE version requires 128k RAM;
- Degas-View XE by MAT*RAT (in memoriam: Matthew Ratcliff)
requires 128k memory (a 130XE or compatible is enough);
- The Cruncher 5.0 by MSL/Magnus Software Limited requires a
minimum of 128k memory (supports up to 320k? memory);
- Code-Cruncher 2.x and 3.x by Adam Bienias both require a
minimum of 128k memory (supports up to 320k? memory);
- Lightraces from Power per Post exists in a 64k and a 128k
version; the 128k version merely works with 128k memory;
- The Wedge 2.x by Ed Bachman needs 128k memory (a 130XE is
enough; but: Antic must have RD access!!)
- Space Harrier by Sheddy needs 128k memory (130XE is enough);
- The Works by Tom Hunt needs 128k minimum memory (supports
also bigger machines up to 256k, but no CS Ramdisks);
- T-34 by Mirage/ANG needs 128k memory (a 130XE is enough);

- Mister X by Power per Post needs 128k memory (130XE);
- Castle of Blackthorne by Thimo Graef needs 128k memory;
(a simple ripp-off of Dungeonmaster & Bardstale, written in
Turbo-Basic XL; unfinished and thus very limited playability);
- Gizmo`s Castle by Black Panther is available in two versions:
the 64k version and the 128k version; if you have the 128k
version you will need a 130XE or compatible machine;
- Oelbaron by ??? (author unknown) also comes in two versions:
a 64k and a 128k version; a 130XE or comp. is needed for 128k;
- Boss-XE by Mirko Sobe needs 128k minimum memory (XE or bigger);
- Boss-X by Mirko Sobe needs 128k minimum memory (XE or bigger)
(works best with MyDOS 4.5x, supports Subdirs & Harddisks);
- ATOS the Mega-Multimedia GUI / Desktop by Tom Hunt requires
a 16Megabyte Harddisk partition or any XL/XE Atari with a
big Ramdisk (256k, 512k, 1024k) and/or a big Floppydrive (180k,
360k, 720k, 1440k densities); this mega-application will not
work on a non-expanded 64k Atari with only 810 or 1050 disk
drive; works best from Harddisk, should also work (slower)
from big floppies and/or big Ramdisks (untested yet);
- MTOS 1.0 and 1.1 by Tom Hunt require 128k memory (XE), there is
also a 256k version of MTOS (64k RAM + 192k RD) available;
- Snapshot by ??? (author unknown) requires 128k minimum memory;
- XL2 by J.K. Picken requires 128k minimum memory; supports also
bigger XE-compatible machines of up to 1Megabyte (?);
- the CTH-Sound-Utility by Tom Hunt (a Wave+DIG Player) supports
64k, 128k, 256k, 576k and 1088k machines; uses 16k RAM+RD for the
Digi-Sound, thus a 64k machine (where only 16k can be used) is
much to small!; does not support 320k machines, nor Compyshop-RDs;
- various Filemanagers/Filecopiers support XE-comp. Ramdisks;
i.e. you need 2 drives if 48k or 64k RAM, only 1 drive + RD if
extra Ram / RD is avaiable (for example: Professionel Copy 1.x
and 2.x, Dos Control, Turbo-DOS Filecopy, the RAF-Commander,
Tight-Filecopy, TOMS Navigator, Spartados' The Browser, Spartados'
The Wedge 2.x, Spartados' Menu, Bewedos' Menu, etc.);
- various 130XE-test programs require 128k RAM, e.g. for bankswitching
tests and/or other things (can be found in many magazines);
- various system-test programs support 48k or 64k as well as extra
RAM; since they were (mostly) written to detect the extra RAM /
Ramdisk, you "should" have more than 48k or 64k memory...
(for example Sytem Info 2.x, System Test 1.x, Memory test, etc.);
- some XE-Sectorcopiers absolutely require a minimum of 128k RAM
(for example: XE-Copier, 130XE-Sectorcopy and many others);
- there are also some Tape programs (Tape-Disk-Copier, Tape-Tape
Copier, Disk-Tape-Copier, etc.) that require a minimum of 128k RAM,
for example VampireSofts 130XE Coolcopy and others;
- there are also some Tape-Ramdisk programs or drivers (which provide
a RD for the Tape users) that require 128k minimum memory;
- no more ideas...

8.13.2 Demo programs:

- Amiga Boink XE by ???, requires minimum 128k RAM; XE=yes, CS=yes;
- American Natives Demo by FOX-1, needs 256k RAM; XE=no, CS=yes,
AM=yes;
(any RD with min. of 192k should do - just use your own RD driver!)
- Asskicker by Shadows, minimum 128k RAM; XE=yes, CS=yes;
- Anime-4ever by ???, minimum 320k RAM; XE=no, CS=yes;
- Base33 by AIDS, minimum 320k RAM; has a RD-setup menu;
- Bill-Pie-Demo by ???, minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- BMW-Ani by Mirko Sobe, minimum 128k RAM; XE=yes, CS=yes;
- CES-Demos by XANTH (full version) needs 128k RAM; XE=yes, CS=yes;
(the full version includes a) the Robot, b) the Fuji-Boink,
c) the Spaceship, d) the SWAN and e) some scrollers, all in
one file of approx. 580 sectors length; there are of course
separate file versions available that work on non-RD machines);
- Cogito by AIDS, minimum 192k RAM; XE=no, CS=no;
- Comet-Demo by Madteam needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Danielle-Gr.9-Ani by Bill Kendrick has a length of 64kbytes and
therefore should load off of a RD or a Harddisk (a Floppy drive is
verrryy slowww); for a RD-machine 128k total memory is enough;
XE=yes, CS=yes; (any RD should do - use your own RD driver!)
- Edelweiss-Demo by A.R. & CSS needs minimum 320k RAM; XE=no, CS=yes;
(a noisy 256k sample + a picture; the much better intro works
without any extra RAM and is also available as a separate file);
- Ergo-Bibamus by Quasimodos, minimum 128k RAM; XE=yes, CS=yes;
- Glashead/HTPPD by AR+CSS, minimum 320k RAM; XE=no, CS=yes;
- Halle 1994B (Wormhole) by AR+CSS, needs 320k?; XE=no, CS=yes;
- (Atari) Hardware-Demo by AR+CSS, needs 320k RAM; XE=no, CS=yes;
- I.B.R.-Demo by MacGyver/AIDS, needs 256k RAM; has a RD-setup menu;
- Igor, Side A by Madteam needs 128k minimum RAM; XE=yes, CS=yes;
- Igor, side B by Madteam needs 192k minimum RAM; XE=no, CS=yes;
- Imperial by Innovative requires 320k memory; XE = no, CS=yes;
- Journey by Polynomials needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Khai-Et by AIDS needs 320k minimum RAM; XE=no, CS=yes;
- Killer-Whales by Madteam needs 320k minimum RAM; XE=no, CS=yes;
- Lajf-Demo by Madteam needs 128k memory; XE=yes, CS=yes;
- Megablast-Sounddemo by DGS needs 128k memory; XE=yes, CS=yes;
- Nascar-Ani by Mirko Sobe needs 128k memory; XE=yes, CS=yes;
- Nonejm by Tight (pre-release of Total Daze?) needs 128k memory;
XE=yes, CS=yes;
- Numen Demo by Taquart requires 320k memory; has a RD setup menu;
XE=no, CS=yes, TO=yes, NE=yes, KP=yes, SP=yes;
- Owca-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Owca-2 Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Parrot-X-Mas-Demo by A.Ramos needs 128k memory; XE=yes, CS=yes;
- Pedrokko-Parrot-Sounds (10 Disks / 20 Disksides by Pedrokko)
partially need 128k memory; XE=yes, CS=yes; (use your own

RD-driver!)
- P.I.T. by Quasimodos requires 320k memory; has a RD setup menu;
XE=no, CS=yes, TO=yes, NE=yes, KP=yes, SP=yes;
- Raving Vierpz by Pentagram needs 128k memory; XE=yes, CS=yes;
- Raytracing Animation by K.Pelzer needs 128k memory; XE=yes, CS=yes;
- Raytracing XE by K.Pelzer needs 128k memory; XE=yes, CS=yes;
(also known as "Landscape-XE" Demo or just "Landscape" Demo)
- Raytracing 320k by Elsni needs 320k memory; XE=no, CS=no, AM=yes;
(written in Turbo Basic - patch the listing for your own RD!)
- (1MB) Raytracing-Demo by Solocoder of Ace needs 1088k memory; XE=no,
CS=no, KP=yes; (comes as a Bootdemo on 8 disksides);
- Revenge of Hacker by Rasero Team needs 320k RAM; XE=no, CS=yes;
- Sweet Fantasy by Tight needs 128k memory?; XE=yes, CS=yes;
- Sheol by Bit Busters needs minimum 320k RAM; XE=no, CS=no;
TO=yes, NE=yes, SP=yes;
- Shiny Bubbles by ??? needs 128k memory; XE=yes, CS=yes;
(there is also a shortened 64k RAM version available);
- Stash-Demo by Rasero Team needs 320k minimum RAM; has a RD-setup
menu;
(first use B for manual choice, then again a) for TOMS or c) for any
other type of RD; do not use b) for Compyshop, since it is faulty!)
- Starwars-Demo by AR+CSS needs 320k minimum RAM; XE=no, CS=yes;
(always boot with Option pressed / Basic off, to avoid stripes...);
- Timekeep(er) by New Generation needs 320k RAM?; XE=no, CS=no;
TO=yes, NE=yes, SP=yes;
- Tit-Demo by Madteam needs minimum 256k RAM; has a RD-setup menu;
- Too-Hard-2 by Animkomials needs 128k memory; XE=yes, CS=yes;
- Too-Hard-3 by Animkomials requires 192k memory; XE=no, CS=yes;
- Total Daze by Tight needs 128k memory; XE=yes, CS=yes;
- Trabant/HTPPD by AR+CSS needs minimum 320k RAM; XE=no, CS=yes;
- Trip6-Demo by Shadows needs 128k memory; XE=yes, CS=yes;
- Ultra by Taquart needs 128k memory; XE=yes, CS=yes;
- Ultra-2 preview by Taquart (unfinished, very buggy and much too
short!) requires 128k memory for whatever reason...;
- Vengeance by Excellent needs 128k memory; XE=yes, CS=yes;
- Vent by Exc.+Pent. needs 128k memory; XE=yes, CS=yes;
- Video Blitz by Helvetica Bold needs 128k memory; XE=yes, CS=no;
(Antic must have RD access, otherwise the Demo doesn`t work!);
- WAF-Demo, Side B by WAF members, two parts need 128k memory
(Raytracing Part and Vector Part); XE=yes, CS=yes;
- Worms-Demo by Datri needs 320k minimum RAM; XE=no, CS=no;
(on a XE or CS-RD you can see the animation with many bugs);
- X-Demo by Madteam needs 320k minimum RAM; has a RD-setup menu;
- X-Files Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by SAG needs 128k memory; XE=yes, CS=yes (written
in Turbo-Basic, just change the entries D8: in every program
part to D1: to make it work on a 64k machine; exchange Turbo
Basic XL with TB 400, Frost-Basic or TB 3.2q to make it work
with Sparta DOS or to run it on an Atari 400 / 800 computer);

- Xyberscape-XE by Bill Le Masurier/TAF needs 128k memory; XE=yes,
CS=yes; (there is also a 64k version available separately);
- Zero-Demo by New Generation needs 128k memory; XE=yes, CS=yes;

8.13.3 from the ABBUC PD library catalogue:
(still active, still growing!)

- PD 52: Der Neffe (engl.: The Nephew), a german text+graphic adventure
requires 128kbytes memory (a 64k version also exists somewhere);
- PD 85: Rechnen fuer Kinder (engl.: Calculations for Children)
requires
128kbytes minimum memory (includes help-guidelines -in german?-);
- PD 86: Diskettenverwaltung 130XE (Disk-Database 130XE) requires 128k
minimum memory (has room for up to 1872 datafiles);
- PD 113: Hires Dump (a print program for Hi-Res. Graphics) requires
128k
memory and prints 8 Design-Master pictures (Gr. 8) on one A4 page;
- PD 121: Der Zeitungsredakteur (engl.: The Newspaper-Editor) requires
128k minimum memory; includes a Printshop Converter, a Hardcopy &
more;
- PD 150: 130XE Impossible Demo (from Belgium), shows a rotating and
bouncing ball, many gfx-effects, a scroller etc., all on one screen!;
- PD 185: Kemna Video (creates Intros for Video-Films) requires
128kbytes
minimum memory; needs Turbo-Basic XL;
- PD 191: Auto-Show 130XE (Car-Show 130XE) shows 8 pictures of old cars
("Oldtimers"), requires 128k because the pictures run off of a RD;
simply change the viewer for 48k/64k Ataris;
- PD 192: 130XE Demo (from SAG, Netherlands) requires 128kbytes memory;
simple Turbo-Basic effects; change the listings (all entries with D8:
into D1:) to run the demo on a non-expanded 48k or 64k Atari;
- PD 209: Raytracing Animation by Karl Pelzer requires 128k minimum
memory and shows 3 different raytracing animations;
- PD 297: Macro-Assembler 4.32 by Thorsten Karwoth requires 128k
minimum
memory and includes also a ML-packer; german docs included;
- PD 303: The Small Printery by Walter Lojek requires 128k memory;
(also supports bigger Ramdisks of up to 1024kbytes), this is a
printer
program for newspaper-like pages or graphics; prints six Gr.8
graphics
a) on one A4 size page or b) on two A5 size double pages;
- PD 333: Hobby-Tronic-High-Resolution-Power-Pack-Demo (HTPPD) by
A.R. & CSS requires 320kbytes memory (and a Compyshop compatible RD);
this double-pack includes the "Glasshead" and "Trabant" Demo;
- PD 337: Landscape-XE Demo by Karl Pelzer requires 128k minimum
memory;
shows a nice raytracing animation with glassbowls in 256 colors;
- PD 349: Fraktale/Colorprint (Fractals & Colorprint) by Peter Woetzel

requires 128k minimum memory; both programs include
window-techniques;
- PD 356: Edelweiss-Demo by Analog Research & Chip Special Service
requires 320kbytes memory (and a Compyshop-compatible Ramdisk!);
- PD 357: Hardware-Demo by A.R. & CSS requires 320kbytes memory
(and a Compyshop-compatible Ramdisk !);
- PD 361: Gizmo`s Castle by Black Panther requires 128k minimum memory
(a 64k version is available as PD 385);
- PD 368 130XE+ Macro-ASSembler 2.2 by Thorsten Karwoth requires 128k
or more memory (works under MyDOS only, supports up to 1 Megabyte
RD);
note that 2.2 is the newer version and 4.32 (PD297) the older one !!
- PD 383: Rund um die Ramdisk (Subject: the Ramdisk) includes many
docs & manuals as well as drivers for creating an Atari 800 and/or
some Atari XL ramdisks (800=D.Byrd, XL=Peterson); the drivers and
testprograms require a certain amount of extra RAM; (e.g. the 576k
tester requires 512kbytes extra Ram, etc.);
- PD 387: Draw XE a Gr. 15 painter program (Shareware) requires 128k
minimum memory; english docs are included;
- PD 396: 1MB Raytracing Demo by Solocoder of A.C.E. requires a 1MB
Ramdisk, type Megaram 3 from Klaus Peters; the demo consists of 8
Bootdisks and does not work (yet) with any other Ramdisk;
- PD 401: Video Blitz XE by Helvetica Bold requires 128k memory and
Antic access !! (will not work on any RD without Antic access);
- PD 466: Kassettencopy (Cass.Copy) by Joerg Gernreich; copies Tapes
to Diskette, one of the three programs (Copy64) needs 128k memory;
- PD 480: Dream Vision, a sort of "universal" IFF viewer from Poland
requires 256kbytes memory (CS,PE,RA,BU,AM,etc.); shows IFF pics
in Gr. 9 resolution on a virtual screen; scrolls in any direction;
- PD 525: Igor-Demo by MadTeam; Side A requires 128k memory, side B
requires 192k memory (and the whole Demo can be viewed with a 320k
machine); works via separate Batchfiles for each configuration;
- PD 526: Extract Slideshow by Replay/Bit Busters requires 128k memory;
shows many fantasy pictures with different fade-in/fade-out effects;
- PD 527: Total Daze by Tight requires 128k memory;
- PD 528: Trip 6 by Shadows requires 128k memory;
- PD 550: Xyberscape XE by Bill Le Masurier / TAF requires 128k memory
(a 64k version can be found on the backside of the disk!)
- PD 564: American Natives by Fox-1 requires 256k minimum memory (any
Ramdisk should do, just use your favorite DOS and RD driver) and
Turbo-Basic-XL (or was it compiled TB?);
- PD 611: Zargon, a german text-adventure by Mapda requires 128k
memory;
- thats it so far (the ABBUC PD library is still growing!);

8.13.4 from the HAPS PD library catalogue:
(still active & still growing!)

- PD0013: 130XE Artshow requires 128k memory; here 15 Koala pics load
off of the RD, simply change the viewer for 48k or 64k machines;
- PD0015: Hi-Res Designer a gr.8 drawing program requires 128k memory;
- PD0031: Utilities (10 test programs for 130XE) require 128k memory;
- PD0091: Koenigsdiamanten & Cavepack both by KE-Soft require 128k RAM;
(these are the XE versions!)
- PD0109: Monitor, Debugger and more; the brief catalogue text says
that the Basic Wedge 2.85 requires a 130XE, however the full docs of
the Basic Wedge tell that it was written on a 130XE and requires
(only?) RAM under the OS ROM (the Basic Wedge expands Atari Basic);
- PD0294: Newspaper-Editor (english version of "Der digitale
Redakteur")
requires 128k memory;
- PD0296: Grafik-Zeilen-Editor (Graphic-Line-Editor) a program to
create
and print disk (and other) labels, requires 128k memory;
- PD0302: Strategy Baseball, a Baseball program for 130XE computers,
requires 128k memory (english docs included);
- PD0303: The Works a layout program by Tom Hunt requires 128k memory;
- PD0308: Multi-Tasking-OS a shareware demo by Tom Hunt requires 128k
memory; also includes a demo for 256k RAM machines;
- PD0341: XE Impossible Demo from Belgium requires 128k memory;
- PD0350: CAD XE, a computer-aided-design package requires 128k memory;
- PD0351: R-Draw 1.3, a hi-res drawing program requires 128k memory;
- PD0434: Programmverwaltung 130XE (Database 130XE) requires 128k
memory;
- PD0437: Textpro 4.5 / 130XE requires 128k memory; there is also the
Atari 800/XL version for 48k or 64k machines available;
- PD0485: Zargon a german textadventure requires 128k memory;
- PD0486: Atari 130XE Demo naturally requires 128k memory;
- PD0514: The Small Printery by Walter Lojek requires 128k memory;
- PD0597: Atari Hardware Demo by A.R. & C.S.S. requires 320k memory
(and most likely Compyshop compatible Ramdisks);
- PD0598: The Starwars Demo by A.R. & C.S.S. requires 320k memory
(and most likely Compyshop compatible Ramdisks);
- PD0617: The Turtles Demo by Ultra Software requires? 128k? memory;
(the file version by John E. of TBSF does, maybe this bootdisk also?)
- PD0637: Autoshow 130XE (Oldtimers) requires 128k memory; simply
change the pictureviewer for 48k or 64k Atari machines;
- PD0789: Cyberscape XE by Bill Le Masurier requires 128k memory
(there is also a 64k version available separately);
- PD0909: Super Print Lab XE (demo version) requires 128k memory;
- PD0936-PD0945: Pedrokko Sound Demos (10 disks/20 disksides) partially
require 128k memory (some long digi-sounds need more than 64k RAM);
- PD1050: Die Wuerttemberger Disk (from ABBUC regional group WAF)
contains the XE version of Gizmo`s Castle which requires 128k memory
(there is also a 64k version avaiable from ABBUC);
- PD1084: Rund um die Ramdisk (Subject: the Ramdisk) contains
schematics and other things to build various ramdisks; the test
programs need a certain amount of extra memory (i.e. the 576k tester
needs 512k extra memory);

- think, that`s it for now...

Note: - XE means 130XE Ramdisk (size: 64k);
- CS means Compyshop Megaram 1 or 2 (size: 256k);
(schematics available from ABBUC)
- AM means Atari Magazin Ramdisk (size: 256k);
(schematics can be found in AM 2/1987)
- KP means Klaus Peters Megaram 3 (size: 1024k);
(schematics available from ABBUC)
- TO means TOMS Ramdisk (size 256k-1024k), this is
standard in Poland [and compatible to Newell];
- NE means Newell Ramdisk (size 192k-4096k),
distributed by Newell Ind. and patched by users;
- RA means Rambo XL Ramdisk (size: 192k),
distributed by ICD and selfmade by users;
- SP means Scott Peterson Ramdisk (size 192-1024k),
where the 1MB version is Newell compatible;
- has a RD-SETUP menu means, that you have to hold
down SHIFT upon bootup to get the setup-menu; here
it should be possible to setup any XE-compatible RD;
- I could only test XE and CS Ramdisks, since
I do not have any other kind of RD;

Thats all so far. Any additions or corrections are welcome.
Greetings, Andreas Magenheimer.

Hi Marius,

> Is there anyone who can provide me a source file (assembler) in which i can
> see how to program more players.

Provided modifying the playfield is off-topic, the recipe for more players
is to have a DLI. For more than four (five) players vertically, you simply
adjust the HPOSx coordinates of a player such that you cut it apart vertically.
This is a common trick that has been used quite frequently.

More than four players horizontally are tricky. With a bit of cheating, you
move the available hardware players quickly between two alternative positions
every VBI such that it appears flickering between the two horizontal positions.
This approach together with the above DLI was used in many games, e.g.
"Joust". If you want to avoid the flickering, you need a horizontal kernel that
really adjusts the player position on the fly while the display is generated.
This requires very precise timing and leaves only the VBI to do the CPU
processing. While possible it is rarely ever worth the trouble.

> I know it is possible. I guess I have to copy the original OS routine that
> is handling the PM-graphics. But I don't know how to get further.... please
> help.

Actually, there is *no* PM support whatsoever within the Os.

So long,
Thomas

LOL!

I'm sorry, but do you realize how absolutely, painfully *wrong* this is?
This is like trying to make a new car by taking a picture of one.

Atari sprites/players are implemented in hardware. GTIA is a video chip, not
a ROM chip. The only thing you can read from it into RAM are its registers.

Message-ID: <HHUc9.115505$On.4903926@bin3.nnrp.aus1.giganews.com>
Source record: 27850

Anyone have an 800XL and a Commodore 1702 monitor? I do and the picture on the monitor is a lot smaller than it could be. Good 1.5 inches of space all around the picture. The monitor doesn't have (at least that I could find) horizontal or vertical size controls. Anyone dealt with this before?

Andy

4322. Assembly language question

```
10 ADTEXL = $CB
20 ADTEXH = $CC
30 LDA #TEXT&255
40 STA ADTEXL
50 LDA #TEXT/256
60 STA ADTEXH
70 TEXT .BYTE "(1) 2716", $9B
```

Help anyone. I'm trying to make some sense of the above. I don't get line 30. Will it load the accumulator with the code for "("? Why bitwise and it with 255? Nothing changes. Why divide by 256 in line 50? It seems like the code is trying to put the address where the TEXT string begins in ADTEXL and ADTEXH but I don't see how it accomplishes that...

Andy

It would be great to see such a computer!!! The CPCNG design is going to be open so it's quite possible to gain enough information to work on a super Atart 800.

I'm not your assembly programmer, but you're right
it is loading the address of the TEXT line into LO and
HI. AND with 255 clears the upper 8-bits, Hmm.
I should shut up, it can't be handling 16 bits.
Anyway, the # means immediate mode LDA.
Dividing by 256 will give the 8 HI order bits of
the address. I guess an address is 16 bits.
Yeah, I think so.

Message-ID: <al1foi$6sr$1@reader12.wxs.nl>
Source record: 27858

The adress of TEXT is (almost ofcourse) a 16-bit adress. If the atari would not be able to handle 16-bit adresses, you could only adres #$FF adresses. The 6502 is an 8bit CPU so when it should handle 16bit adresses the adres has an LO part and an HIGH part. Another whay of writing that down is:

```
LDA #<TEXT ; low part of the adres of text
STA ADTEXTL
LDA #>TEXT ; high part of the adres
STA ADTEXTH
```

As you can see the adres is finally saved in $CB and $CC, this is called ZERO page, and very handy for handling 16 bit adresses:

```
lda ($CB),y
```

in fact the atari peeks (get) the value out of the adres: $CB + $CC (*256) + y and puts it into A

Sorry for this garbage English.
More questions,
just put them in here
Greetz,
Marius

4330. FA: Atari 8 bit items

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-03 05:13:39 UTC
From: Don <atari@qnet.com>
Message-ID: <3D744503.D0E7C55A@qnet.com>
Source record: 27859

I have a few Atari 8 bit items listed on Ebay check them out at:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewSellersOtherItems&userid=atari%40qnet.com&include=0&since=-1&sort=3&rows=25

Thanks,
Don

4331. Re: MAC/65 - large listing problems

Hmmm that is an idea indeed! I forget to write that I did the ASSEMBLING to
memory (with .opt obj)

I should try to assembling the code to ramdisk (or diskdrive)

Thanks,
Marius

```
Some more words about this:

Atari builds up your screen by some kind of supermarket-list... it is called
the displaylist.

In this list every SCANLINE of your tv can be manipulated.

The adres of this displaylist is a 16 bit adres and stored in 560 AND 561.
560 is the lowpart and 561 is the high part.

8 bit values or not higher than 255, so IF the high part is 1 (one) and the
low part is 0, you have 256:

Lo part = 0
Hi part = 1 (* 256)
= 256

In basic you could type
DL=peek(560)+peek(561)*256

after startup basic I get:
peek(560)=32
peek(561)=156
DL=39968

THAT is the startadres of the Displaylist.

The first "command" of this displaylist is:
peek(DL)
=112
That means: 8 black scanlines (that is part of the black lines on top of the
screen)

If i want to see what is on line 12 of the display list I will type:
? peek(DL+12)
2 (means one graphics 0 line)

The meaning of all displaylist commands could be find in Mapping the ATARI
or another atari book (internet?)

IN assembler all this would be:

*=1536
var *=*+1 ; this reserves 1 byte for var
var2 *=*+1 ; this reservers 1 byte for var2
LDA 560 (read 560)
sta $cb
lda 561 (read 561)
```

```
sta $cc
ldy #0
lda ($CB),y ; reads ($CB + $CC (*256))+0
sta var
ldy #12
lda ($CB),y ; read ($CB + $CC (*256)) + 12
sta var2
```

After running var=112 and var2 = 2

You see?
That's it
Marius

For some reason I think you may be missing a space in the instruction lines.
I added them to your example. The bit of code as you posted is non
functional: It needs a branch or jump or something between lines 60 and 70
or you will get a crash. Been a REAL long time so double check me.
> Help anyone. I'm trying to make some sense of the above. I don't get line
> 30. Will it load the accumulator with the code for "("? Why bitwise and it
> with 255? Nothing changes.

This had a "START" or ".ORG" or "*.=" or something in there to tell the
assembler where to put the code. Most likely it was something simple like
$2000. Line 10 and 20 are just variables and don't advance the program
counter. Line 30 would take two bytes located at $2000 and $2001, line 40
would be at $2002 and $2003, etcetera and TEXT is a variable that will point
to the string at $2008.

If you have a programmer's calculator, $2008&255 => $08
Likewise $2008/256 => $20

6502 processors use a low byte/high byte format as a 16 byte memory ref for
several addressing modes. In memory after this runs $CB would have $08 and
$CC would have $20 in them.
> Why divide by 256 in line 50?

Preforms the same as shifting a 16 bit number to the right 8 times w/o
carry. The $08 disappears leaving only the $20.
> It seems like the
> code is trying to put the address where the TEXT string begins in ADTEXL
and
> ADTEXH but I don't see how it accomplishes that...

Assemblers are neat little tools. They do all the math and number keeping
like program counter, variable names, variable values, etcetera. I am old
enough to remember doing all this by hand on sheets of paper. You used to
have to figure out how many bytes each instruction used and where your code
would end up in memory just like I did in the above example. Then you would

notice you forgot to put a branch between line 60 and 70 and have to start all over with the new values. You no longer need to know how many bytes of instructions you have used and where in memory the string is, all automatic and we are better for it.

Yes, I left lots out. As it is it does nothing. I just showed a piece of it.

"If you have a programmer's calculator, $2008&255 => $08
> Likewise $2008/256 => $20"

This is what I don't understand - $2008&255 = $08. The accumulator is 8 bits. It can't hold a 16 bit address. Suppose the line simply said LDA #TEXT (without the &255). How does LDA #TEXT put the 16 bit address $2008 in an 8 bit accumulator?

> The accumulator is 8 bits. It can't hold a 16 bit address.

Not the 6502 CPU processes this instruction, the assembler does it, and
that does understand labels and 16bit arithmetics. The CPU sees only the
result.

> Suppose the line simply said LDA #TEXT (without the &255).
> How does LDA #TEXT put the 16 bit address $2008 in an 8 bit
> accumulator?

Not at all. Depending on the assembler, it might put the high byte, the
low byte or random data into the accumulator. Or it might generate a LDA
$TEXT instruction instead (in this example, that would mean a LDA $2008)
- or print an error message.

Assemble to ramdisk in stead of to memory, like:

ASM,,#D9:DEMO.COM

and then run it from there...

There are ways to emulate the PM hardware registers, making them software players. Several games from Poland and Czech republic
use this trick to have more then 5 players...

There are no real differences I think, except the software registers will be handled as they were PM hardware registers. Probably
easier to move them around as you can use the same routines for both your software and hardware players...

> 70 TEXT .BYTE "(1) 2716", $9B
>

TEXT is the address for the byte string. The address is two bytes
long.

#TEXT&255 ANDs it with "255" which removes the top byte
and just gives the low byte.

#TEXT/256 wipes out the low byte and just leaves the high
byte.

ADTEXL is a location used to store the low byte of the
address of the TEXT string.

ADTEXH is a location used to store the high byte of the
address of the TEXT string.

The above loads ADTEXL,ADTEXH with the address of the
.BYTE string. I would guess that later those are used
for indirect addressing to go through the .BYTE string
and do something with the data there.

> Help anyone. I'm trying to make some sense of the above. I don't get line
> 30. Will it load the accumulator with the code for "("? Why bitwise and it
> with 255?

It loads the accumulator with the low byte of the address of the .BYTE
string (address at TEXT) for one reason - so it can store it somewhere
(using STA).

>Why divide by 256 in line 50? It seems like the
> code is trying to put the address where the TEXT string begins in ADTEXL and
> ADTEXH but I don't see how it accomplishes that...

Well, #TEXT&255 is the low byte of the address and #TEXT/256 is the high byte.

The address is two bytes long, but the registers only hold one byte.
So it is broken down into the two bytes that make it up.

The assembler can handle 16 bit arithmetic (the addresses
are sixteen bits and it has to be able to calculate offsets
to JMP to various locations). However, each address can
contain only 1 byte, so the assembler takes the address
TEXT (which it can handle, sixteen bits) and converts it
to bytes each of which it can store in a location.

> Anyway, the # means immediate mode LDA.
> Dividing by 256 will give the 8 HI order bits of
> the address. I guess an address is 16 bits.

64K machines (well, 48K on the 800, but 64K on the 800XL
and the 130XE has a 64K address space with banking in
and out some extra memory to that address space).

To access 64K of address space, the addresses are 16 bits.

> bit accumulator?

It can't. It probably would put just the low byte.
That probably depends on the assembler.
By specifically ANDing with 255 it makes it clear
what is going on. Other assemblers may have different
code (eg. #TEXT< for the low byte).

Of course, you have to divide by 256 to get the high byte.

Ah! OK, you are mixing the assembler with processor. Yes the A register can only hold 8 bits but the assembler is a program that can do 16 bit math. Equate an assembler with something like the sophistication of the BASIC cartridge that can even do floating point and trig functions despite the fact it is just an 8 bit processor.

The assembler<program> never actually performs a LDA $2008&255! All it does is translate the source code into something the processor can handle.

I have the same setup; but the picture takes up the whole screen at least when I put cartridges pole position and qbert in. When I booted with the basic, I do have space around the picture. There's about a half inch on the sides and bottom and an inch on the top. The same thing when I booted up Altenate Reality Dungeon on disk.

Hi all, I bought my first Atari (an 800XL with 1010 cassette drive) in 1983 but am currently stuck with this dumb old PC. I am just now discovering the wonderful world of emulation and am finding I need a bit of help. I have Atari800 plus 3.0 and am using it under Windows 98SE.

I can't seem to find an OS-A rom. Could someone please point me to some good sources for obtaining roms?

Also, I'm trying to play the Cosmic Balance .atr file that I downloaded from Holme's Atari 8-bit Games (http://homepages.paradise.net.nz/atari/) and can't seem to get it to work. I was wondering if there were any known issues there that I should be aware of. Thanks in advance for help and advice!

Jim

The DOS emulator "PC Xformer" from Branch Always Software (BRASoft,
now known as Emulators, Inc.) contains legal copies of the Atari OS and
BASIC ROMs. (Permission received directly from Atari.)

Version 2.5 is the best-known version to contain the ROMs.

These ROMs work in other emulators, such as Atari800, but cannot be
transmitted except as part of the XF2.5 package. A free version is
available, and does include the necessary ROMs! :)

-bill!

Someone is selling an ATR8000 on e-bay. I have a few questions.

First of all, it doesn't come with software. Where can I get software for it?

Second of all, what exactly does one use the ATR8000 for? It's a 4MHz Z80 that runs CP/M 2.2. Does the atari act as a terminal for accessing the CP/M stuff? Can the Atari DOSes (MyDOS, SpartaDOS, etc) access the floppies on the ATR natively?

Thanks.

A come back like that actually says more about you! Oh no, I'm beginning ot sound liek you ,aarrgghhhh!!!!! nice web site by the way!

> In case you're using 6 bits ASCII, there are brackets around "we" and a questionmark right after it...

Ya, ok , fair enough. But you do know that a 6-bit ASCII would in fact, include the "?" but not the the "we" bit? Perhaps the European CPC have different ASCII then the American Atari? lol

>
> Now I quit, cause I want to stop the thread...

Yes, the posting is more suitable to the Amstrad CPC 8-bit newsgroup then the Atari 8-bit group, of course. But read the last line of my post, "It may be of interest to other retro users" or there abouts? And it is, it brings up interest of a Next Generation Atari. Also, a lot of the materal in CPC Oxygen is of interest to Atari users as well, such as the game reviews of past issues. A lot of the same games were released on both 8-bit CPC and Atari and most played the same, so reading these reviews is of interest. So there, the message has some place.

Source record: 27892

The assembler just does the math you specified and generates the objext code
for the CPU to execute eventually.

The LDA #TEXT&255 is doing a bit operation to generate the actual operand
for the LDA; when you AND the value of TEXT (say it is $2008) with $00FF it
will always leave just the low 8 bits ($08 in this case)

Same with #TEXT/256; $2008 divided by $100 is just $20.

I don't know of any sources of software and you would definitely need the CP/M code if you intended to use it.

The ATR8000 is a general interface; check the scanned ad on my Atariland page. Those are great photos on the auction site. The ATR uses a standard PC type power cable and receives 13 pin SIO cables. It includes a 4 drive disk controller for standard floppy mechanisms; I know it accepts DSDD 360K 5.25 inch. It is also reported to control 8 inch and 1.44 3.5 inch and 1.2 5.25 inch floppies. You may need to build cables for the RS232 and parallel printer signals from the edge card ports.

The Atari disk controller can boot from SD or DD MyDos or Sparta or Atari 2.0 floppies in a 360K 5.25 floppy or you can daisy chain an 810/1050. The ATR plus a generic drive is seen by the Atari as just a normal disk drive.

If it works the way I think it does, the Atari just acts as a dumb terminal
and if you have a floppy connected to the ATR it would boot any bootable CPM
disk. Just hypothesizing, never actually used one. I do wonder what the
reserve is on this, I've been eyeing this auction for a couple of days now.

Hmm most people like to use there unmodified Atari or a little modified
Atari that's 100% compatible. When adding upgrades like enhanced processors
like the 65c02/65c816 or other gadgets you lose some compatability and then
some software doesn't run. It's also nicer to run software on a normal old
Atari.
This kind of people also don't like emulators aswell and hate PC.

I do like a new development like a new Atari but more like a second machine
but it would never replace my old Atari. In my opinion software that's being
wriiten should always run on a normal machine, so everybody could use it.

I have it, but I do not know what the legal issues are in this case as I do not know
if anyone still owns the rights to it.

>
> Second of all, what exactly does one use the ATR8000 for? It's a 4MHz Z80

>

Yes and yes. If you boot up there terminal package, it turns the Atari into a
terminal and allows you to boot CP/M disks. Also, it works with all of the
major DOS's (at least of that era, I have not tried any of the further updates).
It supports 3 1/2, 5 1/4, and 8 inch drives. In CP/M it can support SD, DD, and
HD. I was able to get 1.4 M on an 8 inch.drive in CP/M. However, I was only ever
able to convince any Atari DOS to format it as DS/DD (720K) floppy. I believe
that the printer port was an automatic--it was there as P:. The RS-232 was a
little more complicated. I believe that it originally shipped with a small program
for the RS-232, and later I received a special version of MyDOS with the
R: handler built in (I can't recall the version number).

Don't know, but this is an Atari 8-bit newsgroup, and putting info in it that refers to anything except Atari 8-bit just don't
belong to this group. The fact that you or anyone else is interested in it doesn't justify the posting. It's just not the right
group to post such things I think. The problem is people will start a thread about it and before you know it everyone starts
crossposting it to all kind of unrelated groups and it will be filled with all kind info noone actually wants to read...

Now I quit, cause I want to stop the thread...

> But still no Apple II or Atari entries (not counting the Lynx entry :)

I've tried, but unfortunately I had to realize that 1K is too damn hard
for a machine without any O/S and 128 Bytes RAM, sorry.

I've given up on both of my attemps.

Thomas Jentzsch (Thrust) tried porting a minimalist version of the
Odyssey 2 'Robot City' game in <1K to the VCS, but had soon to give up,
too.

Just like me he decided to do a full blown version instead :-)

I'm not sure if some more VCS projects are still in the works. Billy Eno
(Warring Worms) said he'll try, but hasn't yet posted any results.

Well, even with none of us succeeding at the contest, it at least
motivated some guys to start something new on the VCS, so I've to thank
you for that! :-)

Maybe if next years competition will have again an option for 2K games,
there'll be VCS entries.

Anyway, thanks for doing it, it's fun. Cool entries so far. I hope some
will result in C= Hacking articles again, they were some excellent
reading.

Greetings,
Mannuel

>
Oh come on John, just admit it's a spam site promotion

You are sitting there trying to wriggle anything to make it fit.

Fact: The only real thing they have in common is that CPC was another
8bit.

Fact: You were promoting your own Amstrad based website in here that
has zero Atari content. Try the same post in the C64 group and you
will get the same thing and you know it :-)

Not True: A bulk of the games on the Amstrad were NOT released on the
Atari, mainly the Amstrad had Spectrum and C64 ports and a line of
their own games...I'd say as an ex UK reviewer that the number of
games on both systems would be very very very low.

Point: If you just admitted it was a spam in the wrong group it would
have been done & dusted, but trying to justify it is daft. If you are
into the Atari then carry on and chat re it but as nice as the site is
it's nil Atari related :-)

It's like being into say Star Trek and joining an ng for it and then a
person comes in chatting about Star Wars saying that it's ok because
they are all Sci Fi things... :-)

They would hang you out to dry in those groups :-)

Come on, Chat Atari 8bit :-)

Well, it's at $150 and the reserve still isn't met. That's a little rich for my blood, especially when the guy is selling it "AS-IS". It might be different if he could guarantee that it worked.

At least he seems to have found the disks.

I've got a Percom drive on the way, so I can use the controller in that for DS/DD drives. That's really all I'm looking for.

Pete

I've got an ATR8000. They are OK if you want one because they are rare but that is about the limit of it. Everything works as advertized, [printer, disk drive interface, RS232].

For the printer/buffer it does use a somewhat standard printer interface cable<same one as old Tandy IBM clones> or at least one you can make from a ribbon cable and some press on connectors. I don't keep a printer on an Atari and most of my word processing is done on an IBM so for me it is something I never use.

The disk drive interface is just that, no room to put drives or power supply for them. I have an old scuzzy box/power supply with 4 drives in it. Cabling is kind of a mess since the box holds two stacks of two vs a single stack of 4 drives. Huge amount of storage, something like 720k 3.5", two 360k 5.25", and one 720k 5.25" drive in the box. The down side is I have never found a way to speed up I/O so I am limited to the stock Atari SIO rate 19,200 baud. For my tastes I prefer using a USD 180k drive with its high speed I/O vs 2 megs of storage with slow I/O. There are also some compatibility problems if have copy protected software or like to use flippys. I think the disk layout may be different then other Atari drives to, something like sector 2 is the first sector on the back side of an XF551 and that sector is 721 on the ATR.

I only have the Sparta DOS RS232 handler for the thing and I have never run it faster then 2400 baud. It works ok, no real complaints anyway. 2400 is about the limit for reliable operation of the Atari anyway.

As far as CP/M goes, I have never been able to boot it on the ATR. Doesn't matter much as I have a CP/M machine anyway. I really seldom use CP/M and the programs that run on it. I think I may still have my copy of WordStar laying around somewhere, it is a dog. The old CP/M versions of things like WordStar and CalcStar are like trying to do word processing on a BBS. You are limited to character based I/O so it takes forever to do a screen redraw.

Hi Pete,

I've had one for a few years, to make a long story short, yes there is a cp/m
with it. There shouldnt be any legal issues since it was shipped with cp/m so
if you need it, somone with a working disk should be able to make a copy
without violating the copyrights to it. Also The floppy interface works with
mydos, Mydos 4.5 has a driver for the rs232 port as well, although I havent
tried the serial port yet since I dont have the cable for it. Also the ram can
be used as a printer buffer when running in the normal atari 8bit mode.

It's the 'promenade' portion of "Pictures At An Exhibition."

(I couldn't remember off-hand, but did a Google search for
"atari xl 'self test'", and came up with:

http://www.atarimagazines.com/v8n2/songwinners.html

... where the song is mentioned.)

I'm sure you could find a MIDI of the song, since it's a classical music
classic. :)

Good luck!

It does sound a little rich, though you don't see very many around.

Your Percom needs to be an RFD or AT88S1PD to have DSDD capability. My
AT88S1's controller will do double sided, but only single density...

I think I've been going about this whole SIO2PC thing all wrong with my laptop. I'm sitting here looking at PCMCIA to serial adapters when it occurred to me that while my laptop doesn't have a regular serial adapter, it does have a DB25 parallel port, and I know there are other parallel port projects out there.

As for software, that's no big deal. I could write the software. Anyone have any idea of how to approach doing an SIO to parallel port adapter? Even just broad general ideas would be a good start.

Sorry, let me expand a bit on what I want to do here, and maybe someone can help me a bit. I basically have two ways of handling this: I can send data 1 bit at a time over the parallel port over one of the 8 data lines, or I can convert that signal, somehow (and this is where I'd need help) to bytes and send entire bytes over the parallel port.

I'm also curious how I'd handle the timing of moving the data. How, on the PC for example, would I know when a new byte is ready? Would I have to time everything myself?

Thanks for any help anyone can offer.

Pete

> it?
>

I bought my first ATR8000 about 1982/3. Its default mode is as a peripheral controller for any 8 bit Atari. Floppies-5.25" go to 1 meg or so, 8", and 3.5" to 720K(1.44 meg needs a 16mHz step clock). It will take any standard printer and use extra ram in the 64K model for a buffer. I use Gemini dot matrix, Canon color inkjet, HP Deskjet 500+, and HP Laserjet 2 and 6(very fast for long documents) printers. I have also used up to a 2400 baud modem for many years though theoretically it can go to 9600(in cpm I guess), but the Atari 850 works better at that speed. Any Atari DOS will work to its abilities.

I have played with CPM and it boots fine, I use the ATRMON built into Omniview. I have also played with the MSDOS Copower board. But, when it crashes, you have to reboot from the beginning! The Atari software was usually much more friendly. I have a hefty CPM library for it.

There was a hard disk adapter for it. Know nothing about it. Later the 8500 shoebox version came out.

While the SIO port is the standard speed, the interleave of the floppies formatted on its standard drives made disk access up to twice as fast.

There can be some problems with commercial games, but sometimes pressing BREAK can continue the boot process.

I have more info on CPM use.

Problem with most Atari disk drives is that the mechanism can't be replaced any more. There is just nothing compatible. I have no such problem with the ATR8000. I just make sure to stock standard and hi density 5.25" drives when I come across a good deal.

That would have been OS/A+ which has the identical COMTAB offset table of
SpartaDOS such that it works the same in either DOS - all three from OSS.

I've found several other problem areas with disk based Mac/65.
Despite the manual's statements to the contrary, star (*) can
not be used to start a comment feild. One space and only one
space is allowed before (;) semi-colon comment feild following
a line number. And a similar to your problem, where sometimes
you can and sometimes you can't have label only lines. When I
have the label only line troubles, it can be tricked into
working right if I tab over and place a single semi-colon
after it as if to add a comment.

You might try adding a semi-colon after your long labels to
see if that will help?

My main symptom when having the above troubles is that the
code won't assemble at all. Mac/65 will give it a try and
then bail when it hits something it doesn't like. But I can
get corrupted assemblies when trying to assemble cartridge
Mac/65 source code so watch out for any non-compatible
commands for the disk versions. Like

.SET 6 which has no disk version work around
.DS which can be substituted with *=*+ for disk versions

Conversions to disk version source code from cartridge source
code should be done on the cart as the problem in disk
versions happens when the source code is loaded. When the
disk versions load cartridge version source code especially
with the .DS directive, they no longer seem able to function

correctly even in editor mode - thus they can not find nor
replace the .DS directive. And even saveing the unaltered
cart source code within the disk version will lead to such
severe corruption of the source code that it becomes useless
to any version of Mac/65. I had quite a time with MyDOS 4.51
source code getting it straightened out such that disk version
users could assemble it, the main culpret there was the rare
two spaces before a semi-colon starting a comment only line
immediately after a line number. Before I converted that
source code, I had no idea that the disk version was so
whacky, but it certainly is.

see Mathy's MyDOS page at

Another way to put all this is to say

LDA #TEXT&255 is the same as LDA # <TEXT and

LDA #TEXT/256 is the same as LDA # >TEXT

Since most assemblers can handle the < and > well, I often just subtitute
one for the other as the AND and Divide way just blow my mind when I look
at it. # < and # > I can read fine.

> the same color. This isn't what I'm looking for!

Sting Arrays are DIMensioned as a single big string, then a byte offset is calculated to get a substring. Always start with byte 1.

Numeric arrarys are two dimensions, must be DIMensioned, and always start with 0.

Keeping the 40 column screen as the best for a text adventure, its difficult to get more than one text color at a time. A bit of assembly programming with Display List Interrupts can get a few results, but really isn't worth it. So you end up with regular and inverse text. Its a bit of work, but I have done multicolor text using player missle graphics as a "show through" for inverse text, though this works best as a background box.

Loading a new font makes a big difference. I created a Gamer font for a text adventure series.

I also have an artifacting font with all uppercase either red or blue. Harder to read though.

The one thing I really miss is the ability to choose font colors/attributes on a character basis in the GR.0 mode. I could do without most of the other graphics modes.

> Howdy *.*!
>
> How can I convert a disk using the DOS2.5 filesystem into SpartaDos
> compatible and vice versa?

It would be very tricky if the 2.5 disk had files beyond sector 720. But, if that is NOT the case then you can just boot any 2.x Sparta, put in the 2.5 disk and copy the files on it over to a Sparta formated disk. Of course this won't work right for 'boot' disks or even ones that use AUTORUN.SYS based on DOS 2.5 system. SpartaDOS doesn't obey AtariDOS type run address behaviour while it will do INIT address loads correctly. Sparta always runs a file from the location of its first load segment, such that your very first line of code in a Sparta app must be a jump to the actual starting address or the code itself must start at the very begining. Loading of start address into 02E0h and 02E1h by means of file header manipulations work in AtariDOS, but not in SpartaDOS. INIT addresses of 02E2h and 02E3h DO work in both types of DOSes - See Mapping the Atari for explaination of AtariDOS type 2 style of doing things. See school of hard knocks for Sparta type.

If you do have files beyond sector 720 on a 2.5 disk, you will have to move them to a disk that is empty so that you get file storage under sector 720. IIRC, there is NO DOS that can copy 2.5 files above sector 720 except 2.5

Russ, did you mean 2.3d Sparta? I don't remember a 3.2d version....

> (x,y) configuration...

For me, the 1Meg of ram gets used in a variety of ways, mostly as a ramdisk...

Currently I use it for the programs and data for the inventory I have.

I used to catalog a large A8 disk library. The data files were stored in the RD, and an index was sorted there for creating and printing document pages. I still index things using it.

Its great for programming..most of the source files can go into the RD for much faster access. Especially when I am workinjg on a graphics utility..loading/converting pictures.

Same thing for copying disks. Either as files, or as mass duplicating. Great for creating folders to sort files to before copying.

I use Paperclip for a lot of letters and documents. It can use up to 256K for its buffers. Its possible when using Omniview 256 that a ramdisk can be set up for other stuff. I can actually have two ramdisks..one can look like a real disk for making a dulpicate disk "image".

When using Bobterm, I cache my uploads and downloads in the RD. Then copy the downloads later from Mydos.

Extremely useful for Archiver and Diskcomm.

There is a program Snapshot that lets you have 2 computer image partitions for quickly changing between applications. Each uses 64K.

The rest of the ram can be shared as a ramdisk. SnapshotHD can be used with Sparta DOS for 64(?) image partitions

I hope to have a demo soon that shows how the ram can be used as a program buffer, data buffer, and string/data space at one time.

One trick I use with Mydos is to keep a DOS disk with the ramdisk format util to setup the ramdisk for the initial boot. I also keep a copy with out the ramdisk program. As long I just use the OPTION key to reboot and the second disk, the ramdisk contents are still there.

Hi,

> I've wondered, during idle moments whether adding a second GTIA or ANTIC
> might be useful in some way. Could you conceivably get 4 extra PMs by
> adding another GTIA, sort of like adding a second Pokey to get stereo
> sound?

not too easy. The problem is that you also need DMA channels to get the player data out of memory, and this data is provided by Antic. However, its DMA timing is hard-wired into the chip and does not allow additional "slots" for more players. You'd also need a second Antic then. But then, the second Antic would have to make DMA as well. In the original design, Antic makes DMA every other cycle, interleaved with CPU RAM access. Hence, to make this happen in first place, you'd also have to double the available RAM cycles:

Multiply RAM access time by two giving you more DMA slots. Modify RAM timing to allow CPU access every fourth (instead every second) cycle. Add a second Antic, and a second GTIA. Get all the timing right.

Sounds pretty heavy for me. (-;

So long,
Thomas

4404. Cool project

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-05 11:24:29 UTC
From: Pete Davis <pdavis68@hotmail.com>
Message-ID: <3d773e9e$1_1@corp-news.newsgroups.com>
Source record: 27825

I just came across this article on Circuit Cellar:
http://www.circuitcellar.com/echips-pdfs/0201/c0201mspdf.pdf

This would be a cinch for hooking up to an Atari. Some modifications to the PIC Microcontroller code and adding a serial interface, and you could connect CompactFlash cards to the Atari SIO port. The circuit is damn simple and the code for accessing the CompactFlash cards is pretty simple too.

Given that a 128MB card goes for about $30 on e-bay, that's 8x16MB drives right there. The costs of building the device are pretty reasonable as well. $17 for the CompactFlash connector, about $8 or $9 for the PIC Microcontroller, and a couple of bucks for the crystal, two caps and two resistors. A few bucks for a wall wart power supply.

The biggest problem is that it's something I'd probably need to do a PCB board for. That's something I've never done before. If someone could come up with the PCB board for me, I'd finance the costs of building a few and code the PICs. I've done PIC stuff before and this would be pretty easy.

Here's basically what I had in mind for modifications to the existing circuit:

1: Wall wart power supply.

2: Add an SIO connector and a standard RS232 port. The reason to add both is that you could connect it to the Atari and the Atari could treat it like drives. One could also write PC software to interface with it to copy files from the PC over to the CompactFlash. They could both be connected at once.

3: Store partition information in the first sector or two of the flash card. Using a simple protocol, the Atari or the PC could be used to access the partition info. Since 256MB flash cards aren't unusual, it could allow more than 8 partitions which you could name, and then assign whichever 8 you want as "active".

4: As an alternative to changing which partitions are active, via software, it could be done via dip switch rockers.

Anyone interested in helping me out on this? Anyone see any problems?

The only real issue I see is that the "sectors" are 512 bytes, but through the firmware, we can simply trick the Atari into seeing each real "sector" as two sectors.

The existing design leaves the entire A, B, and a good chunk of the E ports unused on the PIC, leaving plenty of room to add other "stuff".

This is a cool project no matter how you look at it. If we could get a couple of prototypes going, I'd be willing to bet that some of you guys out there would be interested in purchasing some as either kits or pre-built... I'm not looking to make money off of this, I just think it would be a cool new thing to have, and frankly, I want one!!!

I also don't see any reason why it couldn't be set up to optionally work at 56kbps.

Pete

The software for SIO2IDE would be great for this project, you're right. As for doing the actual SIO2IDE, it's a great project.

I think the CompactFlash project has some advantages as well. For one thing, the device itself could be run off of a 5V wall wart or even a battery. It might even be able to run off the SIO power, though I think I prefer to use a separate power supply.

The other big advantage is you could use multiple cards and simply replace cards whenever you want.

You can use CF with SIO2IDE. Look here (CF2IDE adapter):
http://www.wau.nl/hemeltje/temporary/personal/miscelaneous/cfadapter.html

In ptactice there are no problems with CF and 5V IO.

Perhaps you can programm it in your phone too, If you cannot find it:

The charachter is the pitch and the number gives the duration.

G 1
F 1
Bb (A#) 1
C2 0,5
F2 0,5
D2 1

Is it a famous tune indeed, and it is a little strange too, because of the
5/4 measure (5 beats in a measure, in stead of the more usual 2, 3, or 4)

Greetz,
Marius

A big problem you may not have thought of will be managing the sector
buffer- PIC's have a terrible register bank architecture. CF devices
generally want you to read/write a block at a time which will pretty
much mean you'll need to buffer a full ATARI sector- even a 128 byte
sector will nearly fill most PIC's RAM and the timing properties of CF
devices will conflict with the SIO's if you try to do the block
transfers byte by byte direct thru to the CF device.

If you want to emulate disks of varying sizes, with varying size
sectors then the problems multiply. A PIC is certainly fast enough &
has plenty of I/O, but the memory model is probably going to make the
software clumsy- and you'll likely end up wasting lots of CF
capability. Some of the fancier PICs might work out better-
particularly if you can interface external SRAM to handle some of the
buffering- but thats turning into a more complex circuit than is quite
desirable.

I think its a neat project- I designed something similar- even laid
out the circuit board, but the software issues became somewhat
intransigent given what I wanted to do; (810/815/1050 emulation, block
storage devices of up to 2^16 sectors, sector sizes 128 thru 1024,
drive indexing schema available thru the SIO port)

If you really want to try it, I'd be glad to email you my extant sourcecode & board layout. The software is a mixture of PIC assembly and MicroEngineering Labs PBASIC and is about half written- the CF interface stuff is written, the SIO protocol code is too. None is tested. For the layout, I used the demo version of Eagle. I found some places that can do small production runs of boards- it ends up somewhere between $50 and $100 for simple 2 layer board runs. I'm not quite sure I have the CF connector placed correctly- its either correct or reversed, but the whole board ended up fairly compact. The only restriction I'll place on the use of the software is that anything built from it must be Open Source (GPL or BSD style license); ie purchasers must get the firmware source & be free to mess around with it.

I'm deferring building a disk emulator along the above lines till I get one of these;

http://www.robominds.com

Its not too expensive given what it can do & it has plenty of capacity for all sorts of neat stuff. Plus you can use 32bit C/C++ and not always be stuck with the dreadful PIC assembly.

If you search for posts by Bob Wooley you will see a few of his comments on
it.

From memory I think he said the adapter/prototype board for it was ~$30. He
also said ~doing it as a cart would be interesting because it would be
available for to more Atari users.

As soon as you start talking ~$15 for a cart, ~$30 for a CF, $30 for an
adapter, plus whatever it costs for the pass through PC board, it prices 90%
of the Atari user base out of the market. It isn't that they can't pay that
much, it is just that they won't.

Just a general rant from me. I bought a Jam Cam digital camera a while back,
on sale for $20 and it accepts CF. Kind of a pisser how you can buy a whole
device like a digital camera for less then you have to pay for CF adapter.
Discourages hacking.

Thanks for all the info. I'd love to see what you have. Actually, I downloaded ExpressPCB and laid most of it out (still need to hookup the SIO and RS232)

Man, I don't know how people do this stuff. Even with 2 layers, it's a nightmare trying not to cross wires. Actually, I may change the wiring a bit from what he has so that I can do a cleaner layout.

As for your comments about the buffering, that's actually not a problem the way this guy has done it. He only accesses a byte at a time. The CF buffers the sector for you. Yeah, it would be a nightmare buffering 512 bytes on a PIC with only 368 bytes of RAM.

For a 2 board run, I'm looking at anywhere from $34-$88, depending on who I go with. If I go with Engineering Express (the guys that do ExpressPCB), I can do 2 boards for $88 but I can do 10 for $142. The first run would probably be 2 boards, try to fix any bugs that I might have, and then I'd probably do 25 boards as a minimum run. With that, I could keep the cost of the entire kit around $40-$45.

I think that would be a pretty reasonable price. If I'm going to do it for kicks (which I would 'cause I love this kind of hacking), I'd be willing to put out a few hundred dollars to get a prototype working.

Source record: 27837

Rick, as I mentioned in my other e-mail, if I do it in quantites of $25, I can keep the cost of all the components about $40 (except for the actual CF card). I think that's pretty reasonable. I'd be willing to sell the kits at cost or close to it.

I'd have to measure interest, but also as I said, I'd be willing to put a couple hundred bucks into it just to do the prototype for myself. If others wanted it afterwards, that would be cool.

In quantities of 25, the costs break down to this:

$10.00 per PCB
$5.50 per PIC
$0.50 caps
$0.50 resistors (probably less, trying keep #s round)
$2.50 for SIO cables
$2.50 RS232 DSub9 connectors
$1.00 Crystal
$2.00 IC socket
$15.00 CF socket

for a total of $39.50

The CF cards run for may $15 for 64MB and $35 for 128MB on e-bay.

The idea that it's easier to expand than hard drives, I think, makes it more appealing than an IDE hard drive. Once you have it, you can add 8 more 16MB drives for only $35, or just a tad over $0.25/MB and you can have as many as you want.

I'm not saying you're wrong. I don't have the slightest concept of what the Atari market is like these days. But I definitely think it's a cool project :-)

Uh... Why don't you do the board yourself? It's not hard at all, all you'll need
is some acid for PCBs, an unerasable (permanent) marker and, of course, the
copper-plated boards, which can be bought very cheap. Oh, and a glass recipient
big enough to let you submerge the boards into the acid. (I use a glass ashtray,
since the PCBs I've done are small enough to fit in there).

Or you could use perforated boards, some wire and solder... (at least, for the
prototypes)

Well, first of all, sure, it's easy enough to do the traces. There are more than 100 holes necessary (50 for the CF connector, 40 for the MPU, and a few more for connectors). Seeing as I've NEVER done a PC board, I think this is a little more drilling than I'm ready for. Not to mention the holes for the CF connector are pretty tight.

This is something that's definitely better left to a professional. I'm going to go ahead and do the PCB layout and pay to have a few boards made.

The latest version of RB6C, or whatever the distribution disk called it, for MyDos 4.534 looks for a series of key presses to determine if the Ramdisk should be formatted during reboot and if Dup.Sys should be transferred. This saves needing a 2nd boot disk.

1) exits with no action saving Ramdisk contents

2) formats Ramdisk and exits

3) formats, copies Dup.Sys, creates Mem.Sav and exits

Any other key or nothing performs #3 plus copies contents of RAMDISK: subdirectory into the Ramdisk.

4422. Want VIC-20 items; have Atari 8-bit, Apple and TI-99/4a items

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-05 18:55:58 UTC
From: larwe@larwe.com
Message-ID: <608b6569.0209051055.4d73cdb1@posting.google.com>
Source record: 27843
Cross-posted to: comp.sys.cbm,comp.sys.ti,comp.sys.atari.8bit

Hi all,

I'm in a new apartment with no space; I need to slim down my collection and lose all the stuff I don't actively collect. Rather than try to sell this stuff piecemeal on ebay, I want to trade my non-Commodore stuff for C= stuff! Items I'm looking for are:

* Most VIC-20 cartridges and tapes
* More VIC-20s, particularly the oldest style with flat PET-type keys
* VIC-1540 single floppy drive
* C128 power supply
* C16 software and hardware
* Plus/4 software and hardware

http://www.larwe.com/inventory.pdf is a list of all the stuff I've catalogued to date - this isn't everything but it is at least the first 9 boxes full ;). Note that of the 3 boxed TI-99/4a's, I know at least one has some extra cartridges in the box (not catalogued separately); I haven't gone down to that level of detail in opening things and inventorying.

I want to lose all the Atari and Apple gear I own (I also have an ST color monitor and a couple of Apple monitors I KNOW of, not catalogued yet), all the TI-99/4a stuff, and the Atari 520ST. Also an Atari Portfolio with manual, and a couple of other pocket computers of the Sharp PC-12xx ilk, not yet catalogued.

The "SHK" column means "shrinkwrapped or otherwise sealed and unopened". The "STLOC" column indicates physical location of the item, for my reference.

I live in Stamford, CT and I'm willing to drive out to you, within 75-100 miles, to trade stuff. Please email if interested in trading! I'll also sell this stuff for cash, but prefer to trade.

4423. Re: Convert SpartaDos Disk?

(Lee asks 2.3d Sparta, or 3.2d version.)
Gee, I don't think anyone uses 2.x Sparta.
I have 1.1 and some 2.x versions somewhere, never
used them.
3.2d was the main one that everyone used/uses before
3.2f and 3.2g. 3.2d had the AINIT. Then there's
the 3.3x ones (a, b, c) 3.3a works on emulators,
B may be for BBS Pro and C is a Video 61 commercial
not shareware cart. Finally there is SpX which goes
up to 4.2x (4.22 the last?). I have 4.20.
You actually use 2.3d?

I considered that, but that would need special drivers, wouldn't it? I'm not really sure how the PBI works, as I haven't done anything with that at all.

What I may do is start with the SIO version and maybe work on PBI version after I get that working. I did consider it, as it would be significantly faster. I'll look at some PBI projects and try to get an idea of how they work as a possible way of going in the future.

Simple as inserting disk 2 or whatever in DF1: etc

ALT+1 for drive DF0: , ALT+2 for DF1: and so on...

Do remember that some items may not pick up a 2nd drive and request a
disk in DF0:

What if you didn't do DMA? I recall reading that you can stick a number
into the GTIA register and make the entire player a certain shape. Could
you do that fast enough to make a player with a second GTIA. Probably not,
I guess. You could use the second set of players for other effects though
but probably not enough benefit for the amount of work required to get that
second GTIA in there.

>Sounds pretty heavy for me. (-;

Yes, I don't think it is viable.

I have heard from many people that think SpartaDos X3.3a b c can not be posted on bbs board for down or just give to a friend. Kenny Aimes and I fix and wrote the chages to this dos and it is shareware anyone that has removed my shareware notice has Violeted my terms of distribution. Now LET me put this planely. SpartaDos x3.3a b c can be give to anyone who wants to use it. And Lance make sure you understand me YOU DO NOT OWN the version of SpartaDos X3.3a X3.3b X3.3c. If you have a problem with this sue me. I could use a new house and car. You purchesed code from Bob klass he did not own. FTE relised all version of SpartaDos as Shareware. Now to be Fair to Lance he did make a cart with SpartaDos X3.3c on it. The Cart is Lances property the compression routeen that make the Cart work is his programers work. the Carts Compression routeen would carry lance's Copyright. Lance I wish wou well on your Cart sales and I have told you than in the past. However If I here one more it of bull about this I will want my part of the cart sales.

I have started work on a new version of a cli interface that can replace SpartaDos. It will be Called Real Dos and carry my Copyright and it will be Shareware.

Anyone wanting to reach me can do so by e-mail sjcarden@bellsouth.net

Well, you'd end up implementing a complete UART in software - not much
fun IMO.

Back in the good old days (tm) I had a software for my Atari which
implemented a serial interface over the joystick port - limited to
300 bit/sec.

Even if you've got a fast PC you most certainly wouldn't want to
handle the serial protocol completely in software: you would have
to do busy-waiting, sampling the input-pin at least 19200 times
per second (IIRC the 16550 does sampling at 16x the baudrate)
and ensure that you don't get disturbed by other processes.

IMO the best you could get is wire the command-line pin to the
interrupt-pin of the parallel port, and then completely lock
your system (disable all interrupts) as soon as a command frame
starts. After processing the SIO command you can re-enable
interrupts and your PC may resume normal operation until the
next command frame starts.

Although this could _theoretically_ work, I wouldn't want to
do it, since it would lock up your system most of the time
(no problem if you would only use DOS, but you wouldn't even
be able to move your mouse in Windows).

Besides the lock-up issue the most important problem is if your
system is able to respond to the interrupt within at most
750 uSecs - this is the minimum time between the lowering
of the command-line and the transmission of the first byte of
the command frame. I really doubt that you can get such a
fast response under Windows in all circumstances (just consider
another driver blocked interrupts for some reason...).

BTW: If you are still interested in doing a software implementation,
you could try searching for "cbm4linux". This is a software for
interfacing a commodore floppy disk (eg 1541) to the PC via the
parallel port. Maybe you can get some new ideas if you analyze
the kernel driver.

so long,

Hias

PBI eliminates usage on an Atari 400, 800, 1200XL and many 65XE's.

Another thing: anyone with a MIO, BlackBox, KMK IDE, MSC-IDE, KP Romdisk, etc, can't use it...

I vote for a pass-thru cartidge :-)

I'm going to shoot for the Compact Flash project instead. It's more hardware
and firmware work, but it meets all my needs and it'll be more fun.

Hmm yes, but It's the same for me then a Black-box/MIO and other stuff some fast I/O storage. So that's why I vote for PBI.
Maybe 2 versions can be made to make us happy.

> Another thing: anyone with a MIO, BlackBox, KMK IDE, MSC-IDE, KP Romdisk, etc, can't use it...

Yep, but you have more then 2 machines and just 2 black-box systems so I don't see a problem here...

> I vote for a pass-thru cartidge :-)

Hmm possible but you don't have all signals there like IRQ...

We will see what the maker of this thing will decide..

This is interesting. Steve Carden and Kenny Aimes.
I hadn't remembered Aimes.
Right now, I can't come up with the name of who
I think worked on 3.2d JOHN HARRIS, of
Jawbreaker and other fame (MAE, GED).
A lot of people have worked with/on SpartaDOS.
Tom Hunt was working on one called SRP (Sparta
Replacement Project.) I think Harris worked on
3.2d and it became 3.2f and g from FTe.
Klass probably had the last formal relationship to
Mike Hohman, and maybe got an agreement from
Hohman that he could 'own' something related to
3.?, which he apparently sold to Video 61.
A lot of people were involved in trying to keep Sparta
DOS alive and well, by making improvements to it.
I think the motivator for Harris was to remove some
serious bugs in 3.2d, one in particular was trashing
SpDOS directories if a channel was left open.
Tom sorta stopped SRP development when he started
working with Video 61 on BBS Pro.
It is all starting to fizzle out/down. I'd say Tom and
Video 61 are the last to still be active with any 'serious'
A8 development.
As I finish rambling, I don't know anywhere that has
3.3C for download, there probably is, but it isn't
widely (meaning I don't know) known. And I don't
want 3.3C as long as it would step on Video 61's toes.
Seems there's, like a fervor of passion about some of
this among certain A8 enthusiasts.
And I'm sure it could get complicated and heated.
The good news is Steve Carden announces he's working
on a new DOS 'Real DOS'. I guess good news.
Of course, Steve, if you are working from a disassembly
or even original source code, uhm, that doesn't make
it yours, no matter how much you work on it.
Opps I seem to have taken sides.

Actually, the SIO2CF will be an interface between the Atari and the PC as well. I'm going to add a regular serial connector so you can move files between the CF and the PC as well. You will also be able to use the PC to configure partitions and format (you'll be able to do that from the atari as well).

Minor point, FTE released the 3.2f version along with the disk based version
of MAC/65 but I don't recall SDX being released.

4449. DGS/PPP CD - New lower cash prices and version for Germany

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-06 18:53:18 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1031339473.27396.0@eos.uk.clara.net>
Source record: 27722

Hello All,

I'm pleased to announce that I've been able to find a better cash exchange service, so I'm now able to offer the DGS/PPP Atari 8-bit CD-ROM for the same price in cash as for credit cards using PayPal. I'm also able to accept cash in payments in Euros as well as US$.

The price for the CD is now US$15 for Paypal or cash in US$, or 15 Euros in cash. However, as you will be aware, I am not able to sell the CD to anyone in Germany, Austria, or Switzerland due to licensing issues. I have, therefore, created a 'cut-down' version of the CD containing just the DGS products: Digi-Studio, News-Disk issues 1-14, News-Paper issues 15-19, News-Paper-on-disk issues 20-26, and the News-Paper Yearly Disk. This 'cut-down' version can be sold to any country. The price for this CD is US$10 for PayPal or cash, or 10 Euros in cash. UK customers can buy either of the CDs by cheque (10pounds full version, 6pounds 'cut-down' version).

Full info on the CDs with ordering info can be found on the DGS website: http://www.dgs.clara.net (click the link to the CD-ROM page).

Thimo, interesting idea. Wish you success.

Carts are so much nicer/quicker than disk/cassette.

I asked Sega about permission for Space Harrier as freeware. The answer was
it was extremely unlikely the Japanese copyright holders (Sega Am2) would
grant permission even for that. I got no reply when I asked Am2.
A few changes will be needed to avoid trouble then....

It'd need a HUGE non-standard cart too - bigger than the 128K carts. I
estimate the game will take up 120K in its compressed form on disk, if it is
finished (maybe by late 2003). The cart would have to be uncompressed to
work with 64K machines - so about a 256K cart.

So, it's an unlikely candidate at the moment

Hope you can rustle up some more support elsewhere

Chris

There are enough signals on the cartridge port to implement a CF interface. The real question is how would you include the drivers and such. What would the architecture look like? In order to be useful, you need some kind of hook into the OS that allows you to access the CF card as a drive or ramdisk or something. The PBI already has this in place, but it takes a lot of hardware and the PBI interface itself. The only useful configuration that I can see thru the cartridge port is to load or unload a large internal ramdisk . For general use, a serial interface (SIO) makes better sense.

Source record: 27726

Yeah, you're right. The only feasible way of doing this is to write some sort of driver to emulate the disk drive, and I'm not even sure how that would work. Yeah, I could do a ramdisk, but that's a waste too.

I'm planning on putting on jumpers to support the 56k speed as an option, since that's pretty easy to change on the microcontroller, but as for doing a PBI interface, I think the audience is going to be too limited and the work, at least for me, too difficult, to be worthwhile.

I think the SIO interface will serve much larger audience and the interfacing is much more obvious. If I do a cartridge version, it's a good ways down the road. I'm going to have to learn a lot more before I'll be ready to tackle something like that.

Going the SIO route simply requires some basic serial communication hardware and a microcontroller and the rest is a programming issue (on the microcontroller), which is where I'm more experienced. The CF hardware interface is already done for me, otherwise I wouldn't even attempt this.

As Bob is aware, I've already begun the board layout, and actually have to start over from scratch, which I'll start tonight. I hope to have the first two boards next week and will hopefully have a working prototype within two weeks. That may be a little ambitious given my work schedule, but that's what I'm shooting for.

Once I get a working prototype going, I'll probably do a second run of two boards with any fixes to the layout that are necessary. I'll get those working and then send samples to Bob and Rick Cortese to bang on a bit and give me some feedback. The first two runs won't have any silk-screen work on the boards.

Assuming this tiny beta-test group goes well, I'll start collecting for a production run from people who are interested. I'll sell the kits at cost. I don't know if I'm willing to build the boards for other people, simply because I don't trust my own soldering ability enough to guarantee anyone that the board I send them will work for a reasonable period of time. I'm sure there are people out there in the community that would be willing to build them for people for a reasonable cost.

If you're interested in a buying one of these (and keep in mind, this all assumes that I'll be successful. This is the most complex project of this sort I've ever taken on.), please e-mail me so that I can get some idea of what the interest is like.

Here's what I've got in mind, roughly:

Hardware:

* Compact Flash interface
* 5V or 9V power adapter plug
* Dip Switches - Only option I know for sure right now is baud rate (19.2k or 56k)
* PIC16F877 microcontroller
* SIO cable and adapter (must be at the end of the chain. Sorry, I don't have any SIO receptacles)
* DB9 RS232 connector for connection to a PC

Software:

* Microcontroller code - Likely this will be upgraded periodically. If you send me your microcontroller, I will be happy to flash the upgrade for you, or you can do it yourself if you have a PIC programmer.

* Atari software - This will basically allow you to provide a "name" for your card and configure the partitions on it. You will only be able to have 8 active partitions at any time, though you may have more than 8 partitions total.

* PC software - This will include the abilities of the Atari software (and will likely be out before the Atari software). In addition, you will be able to copy files either raw PC files, or files from ATR files, to your partitions. This functionality may not appear in the first release. Depends on my progress.

All software (PIC, Atari, and PC), hardware layouts and documentation will be released as source and binaries as open source/freeware. This way people can feel free to add their own upgrades wherever they want.

Yeah, but you're talking about up to 512MB of ram on a CF card. I'd expect to be using 128MB or 256MB cards myself. I don't even know where you'd find all the addresses for that much on the Atari. You could do 4MB, maybe, but 512MB, no way.

The Atari just doesn't have enough address lines and PortB lines to support that.

Pete

See my other response regarding Ramdisk. It's just not feasible for a CF card on the Atari.

As for the DIP switches, there are a few things I was thinking about. One would be to enable and disable the active partition for D1: Another thought was to be able to swap some partitions at "runtime." By runtime, I mean while the Atari is on, be able to, say, swap partition 4 with partition 13. That kind of stuff. I don't know if I'm going to do that, though. Turning partition 1 on and off would be useful, though.

Keep in mind, it would work something like this: If you had a 128MB CF card, that would work out to 8 - 16MB partitions, or D1:-D8:. That's just a single card, so you wouldn't have a dip switch to assign the drive IDs since a single card may encompass many IDs. This would all be handled through software either on the Atari or on the PC. For example, on a 256MB card, you might have 16 - 16MB partitions. Only 8 of those would be active at any given time, as the Atari can't access more than 8 drives at a time, and partitions can't be larger than 16MB with most Atari DOSes (are there DOSes that will handle more than 16MB on a partition?)

Hope that clears some things up.

Pete

I'm thinking DOS 2.5 uses a special character for the file flag in the directory for all files that are above sector 720 and as such can't be seen by other DOSes. If a file winds up above 720 but starts below 720 then its good to go for most I would think. But I'd really have to crank some things up to check it out for sure. Still standing by how I remember things to be...been a while and my memory has been proven wrong before.

Russ, 1.1 was for 800s, 2.x for XL/XEs, and 3.x only came out under FTe??? 2.3d is solid as a rock, 3.2f is flaky for me, and 3.2g won't do re-direction worth a hoot - try sending a directory listing to the printer to see what I mean. Plus its missing AINIT. I haven't seen a thing in 3.x that's any better than it was in 2.3d.

You can't do that with the cartridge slot. The cartridge slot simply provides address and data pins. No IO support. The only way to handle it would be to break up the CF cartridge into groups of 1-4MB RAM banks that you could switch between.

You could come up with some sort of driver that uses an area of RAM to move the data back and forth, but honestly, I'm not sure how that would work exactly. I'd need to learn a little more about how that would work.

As for the PBI port, I'm not sure what the options are. I'm sure it's more flexible in that way, but either way, they're both out of my league since I don't know what all the ramifications are of doing an interface through these ports.

Yeah but...

A SDX or Supercart type boot that could switch itself out would be nice. It would get kind of tricky working around all the $D500 stuff like Action! and SDX to make them continue working.

Just guessing: A lot of people would be happy to just have 16 megs of games on a plug in cart with a simple boot or navigation menu. If it actually does real I/O so you can run SpeedScript and save your work, that would take care of the bulk of who is left.

I think the idea of a small footprint system w/o a bunch of drives for storage would be appealing to some people.

Of course if it was just a doorknob size box that you can plug directly into the SIO port sans cable and draws it power from the Atari 5V supply you have essentially the same thing.

4461. Single cycle circuit

Newsgroup: comp.sys.atari.8bit

Years ago, when I built a 6502 based printer interface, I built a 6502 single cycle circuit from information in a Rockwell technical manual for the 6502. I resurrected it. It has 2 switches, press one and get a single machine cycle. Press the other and get one instruction. The thing doesn't work now though and I don't know what happened to my Rockwell 6502 hardware manual that had the single cycle circuit in it. Anyone have it?

Andy

You really should invest in a webbrowser so you could check it out
yourself. I recommend CAB 2.8 or you might try to be as clever as the
original poster and try Lynx via the CLI at your ISP...

This valuable advice may be of good use to all readers in the 5
newsgroups it's crossposted to...

The main reason is that it's only on the 600XL and 800XLs (Is it on any other models?) That limits any projects that use it to a small audience. I could maybe build this for the PBI, but then I couldn't use it on my 130XEs. I like my XEs. I like my 800XLs too, but I want something I can use with both. The SIO is on every Atari.

For Ramdisk-usage, no problem since you need to load a driver for any ramdisk. To directly boot from it... well... should be
possible if the cartridge has some hardware to disable itself. SDX also boots from cartridge...

> For general use, a serial interface (SIO) makes better sense.

For general use... Yes.

For speed... No.

An extra Dipswitch for setting the ID# would be nice so you don't have to boot from it while still having the CF enabled.

And while you're on it, make it counting up to "D8:" in stead of that limited "D4:" most diskdrives are using :-))

Why not? No need to address them all at once. Just devide the RAM into partions, like my 676MB harddisk on my Black-Box.

> The Atari just doesn't have enough address lines and PortB lines to support
> that.

Since the CF card will not be seen by the ATARI as linear or bankswitched RAM, but as an I/O device in stead, addressing the thing
is not required...

p.s. Addressing 512MB of RAM or way beyond is possible too when building the extra RAM into the ATARI. Just a matter of stacking
PIA's... Will take some time untill the Ramdiskdriver has found all the banks but what the heck... In need for some Terrabytes of
internal RAM ? No problem. Just use the stacked PIA's to drive another set of PIA's and use the first few MB's of RAM to hold the
RAM-banks-table...

Useful? No, but nice, however I think you'll need an extra powersupply for this :-)

I downloaded the pdf and looked at the circuit, its pretty much what
one would expect. I still think that you may run into timing issues
between the CF card's I/O timing and the documented Atari SIO timings-
which will more or less end up requiring you to buffer sectors. With
a 1 sector buffer, the timing conflict can be trivially solved. I may
be wrong, but I spent a good deal of time trying to figure out how to
do the direct to/from CF card I/O and never came up with anything
satisfactory. Naturally, its always possible I misunderstood
something or was just plain dumb... IIRC, the problem mostly has to do
with writes, particularly ensuring the CF card is ready for the
transaction before the sector bytes start arriving.

I have my project files zip'ed and will upload it as soon as our ISP
gets its act together- the server is down at the moment. Should be be
this afternoon sometime- I'll post here when its up.

Good luck with the project!

Gregm

Source record: 27742

Greg,
If that's the case, the 16F877 does have 368 bytes of ram, so I could fit an "atari" sector in memory, but not a whole CF sector. That might be a problem for writes, as I'll have to write an entire 512 byte sector at a time. Maybe I'll have to look at another PIC. There are a few with more RAM (up to 1.5K). I'll have to see which ones fit in with my design.

I hadn't even thought about the write issue before. I have to read in half the CF sector before writing since I'm only going to write 256 bytes at a time from the Atari.

It turns out I can get the boards built quite a bit cheaper than I thought, so that leaves a little room to play with the PIC cost. I want to keep the price under $40 if I can.

Pete

Greg,
I'm looking at the PIC18F452 as a possible replacement. I need to examine the pin compatibilties, but initial impressions are very promising.. It's got a few advantages. It's about the same price as the 16F877 and has 1.5k of RAM. It's also got twice as much flash for a total of 16K words of code. I was actually concerned about the 8K limit for handling everything. I'm not the most efficient PIC programmer.

That gives me 2 CF sectors worth of ram plus an additional 512 bytes for things like the partition table and stuff. It's also got more interrupt sources than you can shake a stick at which can come in really handy.

Finally, it can go up to 40MHZ. Don't know if I'll need that much speed, but I'm going to check the calculations on the baud rate generator. If that can give me better timing, it may do well to do the Atari SIO through that, especially if I'm going to handle 3x speed.

Fox, that sounds promising, actually. Combining the cartridge port with the SIO may actually be fairly easy to do.

The fact remains, however, that it's been at least 15 years since I've really read the Atari OS source and I don't have enough knowledge of the cartridge port to be ready to tackle that as a project right now.

It's definitely something to keep in mind, though. For now, I'm going to continue down the SIO road. I'm much more comfortable with taking that direction at the moment. I had enough trouble laying out this board. I'm looking at at least a month before I'll have a released product anyway. That's a lot of time to pick up additional knowledge. After I've got this thing done, I'll start looking at future directions.

I don't think it's been done before. Only read a few thing about the theory, but if you're that far you can emulate a
SIO-(diskdrive-)device I don't see a reason why it shouldn't work.

hmm but the PBI is a very fast bus, mostly NOT used because it seems to be
difficult. Why not make more use of it. Especially for RAM (disk) it should
be quick.

You mis-remember; any file containing a sector above 720 gets that
'enhanced' status byte. They were apparently more concerned with writing
back to a file in the inaccessible area above 720 than to just reading.

Sparta 3.2d came out under ICD; at least their label is on the original
disks. Pretty certain it dates to '86 or so before FTE was in the picture.

Hi,

The 130XE has also an PBI it a combination of the ECI and Cartridge bus. I have several pcb's that convert the PBI and Cartridge bus to 'PBI' like the 600/800XL and a cartridge slot like the XL/XE .

So that could not be a big problem...

Hi,

I just got an original Atari RAM upgrade for my Atari 400. It's an upgrade to 48Kb. I noticed on the board is printed 64Kb. Is there a way to make use of the extra 16Kb on this board?

Secondly I saw there is some soldering needed to upgrade, that's not a problem but I would like to hear some experiences with this first before I start.

That sounds like a great chip. I've done a fair bit of pic
programming, but always on the 16C series- very tight on ram along
with the execrable ram & rom paging stuff. Those page select bits
always messed me up. I was writing for the 16C77 and was about 1/3
full with the low level routines, so I was confident I could fit it
in. I was planning on a 20mhz clock- which let me arrange some
interrupt-driven timers/counters/etc reasonably well, so I imagine
anything faster than that would do just fine.

I think rigging the CF device to a real interrupt is a definite plus.
I ended up hooking the int assert line to a regular pin & polling it
as required. Not the best approach perhaps, but it let the software
be simple.

wrt the ram size, I think only a single sector needs buffering- which
leaves you loads of ram for the software. To the extent I worked the
logic out, the sector buffer was only needed for managing data just
before or just after a CF transaction. Plus having it, you can do 512
byte sectors if you want- or get fancier than that.. :)

Its much better than a 16C device. Just for curiosities sake, what is
the 3x mode? I was only planning for the general 19.2kb speed? Is it
tweaking the Atari's SIO baud rate divisor to bump up the SIO baud?

Thanks,

Gregm

Hi,

I am looking for the following hardware:

Parrot sound digitizer
Mytek genlock
Computer eyes
Bitwriter for superarchiver (or both)
ICD MIO 1Mb or 256Kb
CSS Blackbox
CSS Mux
Memory upgrades (newell, rambo etc)
ICD US doubler (original)
ICD SDX
ICD R-time 8
Diamond GOS (Cartridge)

Send me an e-mail when you have something from this list
txg@the-underground.myweb.nl

Thanx already..

Greg,
SpartaDOS and I think MyDOS both support 56Kbps and maybe even 76Kbps transfers. Honestly, I'm not sure how they do it, but I know certain drives acheived this speed and some of the drive upgrades for the 1050 allowed this high-speed transfer.

Fortunately, from the PIC point of view, I don't have to concern myself with how the Atari does, I just have to set the baud rate generator for 56Kbps.

Yeah, I've actually been out of the PIC programming stuff for about 4 years, and I'm now looking over what they have and I'm very impressed by their line now. Lots of 20 and 40mhz chips with lots of cool new features. I'm still learning quite a bit. Lots of datasheets to go through :-)

Thanks for your information. It's very helpful.

Source record: 27757

(ok, 1.1 is for 800, 3.? FTe?)
3.2d was the one I used for may years, was I think
the standard one before FTe made the 3.2f and g.
I found XC23E.DOS and XD23E.DOS on my
3.2d distribution disk, I guess one of these is what
you call 2.3D (sorta a question.) I can't find a 2.3d.
The book that came with 3.2d mentions XD23B.DOS
and XC23B.DOS, so I guess there's some 2.x I don't
have.
re-direction. Uhm I haven't had a printer since 3.2f and
g, so I'll take your word. 3.2d did fine with autorun.sys,
startup.bat and -xxx.bat redirection. We talked about
3.2g not being able to copy TEXTFILE.TXT E: or S:,
this was done to avoid the COPY FILE.COM FILE.COM, causing to wipe out
FILE.COM, if the
file/device opens successfully for read, then 3.2g
says 'file already exists', even if it is E:, S: or P: you
are trying to COPY to.
For sending program listings to the printer, the G:
device was neat, it did ATASCII inverse and special
characters, which a plain COPY FILE.BAS P: won't
do.
But I ramble.

(COLD for what I'd call a warmstart.)
Now that's something I miss in 3.2g, the RUN
command, RUN E477 (or was it E474?). SpX
doesn't have the RUN either. There is an external
RUN.COM around, but I liked the internal RUN
command of 3.2d.

Hi,

I am looking for the original Tiger Attack from Atari. This game was
released in 1988. I don't know if it was release on tape or disk or both.
Maybe someone can tell me this also.

I have it on disk but this is NOT an original... Where could I get it...?

> would be to break up the CF cartridge into groups of 1-4MB RAM banks that
> you could switch between.

That's what I was saying, more or less...

But with extra hardware (a VIA for example) one can do I/O thru the cartridgeport without too much difficulties. This is the way
the MUX works.

> As for the PBI port, I'm not sure what the options are. I'm sure it's more
> flexible in that way, but either way, they're both out of my league since I
> don't know what all the ramifications are of doing an interface through
> these ports.

Technically, the PBI is a great thing. When using a ROM with code in it you can swap it with floating point ROM-area on the fly so
your ROM is fully integrated in the O.S.

The biggest problem is compatibility. The 600XL and 800XL are the only 8-bits that have a true PBI bus. The 65XE/800XE/130XE
basically also have a PBI port, but it's devided into two seperate ports (cartridge and ECI port combined is PBI). Problem is to
physically connect a PBI device so you'll have to find a way to have two types of connections on your external PBI device. Next
thing is, when it's connected to an XE it takes up the cartridge slot, so bye bye SDX, BasicXE and ACTION! users.
O.k, just add an extra cartridgeslot on your PBI device. It has been done before on the BlackBox (and the MIO when using a PBI
adapter). Result: extra costs, more work, larger PCB, etc...

At the end it is still only usable for those who have this XL or XE computer. Everone with XEGS, 1200XL, 800, 400, or 65XE without
ECI-port still can't use the thing...

Reminds me to another thing....

Years ago some people in the Netherlands (Yeb Havinga? and ???) were talking about a kind of SIO2PC interface with parallel
transfer capabilities. Something like an interface that would connect to both the SIO port as the cartridge port. When booting a
"disk" on the Atari it'd start it from the SIO-part, which automaticly loaded a driver to redirect I/O to the cartridge port.

Turbo-Dos has two modes of operation: DOS 2.x compatibility, or not. Default is 2.x compatibility. All others I mentioned can
read and write 2.5 disks without problems...

> mean. Plus its missing AINIT. I haven't seen a thing in 3.x that's any
> better than it was in 2.3d.

As for the 3.3 versions, the shorter MS-like commands are easier for those that are a bit used to M$-Dos. 3.3 Also supports the
MUX, detects if a BlackBox is connected, and has a few extra internal commands, like COLD for coldstart, CLS to wipe screen, VER
for version#, ECHO ON/OFF to turn on/off Antic, etc...

As for AINIT, the external SINIT always worked for me...

> Well, this is surely untrue. collectors pay much money for old games.
> But they do not pay much money for brandnew games (except if they are
> limited!)

This may be ,because of this I want to use my "cheap" XE or XL carts
first instead of producing entirely new ones.

It worked on the ATARI 2600 market.New games like Thrust did sell
well- they sold these games with boxes/manuals or cart only and prices
are $20 or more.

This may also work on the XL market.So Iï¿½d try this at first with old
Crossbow carts or other XEGS / XL carts.

I think if you put good games on carts,maybe converted arcade/C64
classics or something special like a First Person Shooter,then people
would buy.

My intention is/was to burn some PD games onto cart, for
> example some Oliver Cyranka and Frank T.Wittenmayer games as well as
> other games from Antic, Analog and other PD sources.

Iï¿½m not sure if these games are PD.Games like "Into Deep" ,
Butterflies appeared in the Computronic in 1987 and the Tronic-Verlag
may still have the copyrights.AFAIK "Paver" is another Wittenmayer
game,which appeared in a Happy Computer magazine.Not sure about the
copyrights today ...

> Normally I do this
> for my own/private collection. but I am currently thinking about

> this will be done, since I am working together on this project with Nir
> Dary who lives in Israel. Next, I do not have any 48k or NTSC Ataris, so
> Nir also has to test them on US machines for me.

Ok , Iï¿½d prefer re-releasing non-PD games on cart.If I can get the
rights.The dream would be the games from EA like Mule , but itï¿½s
impossible.
Maybe something from a smaller company.Nir suggested English Software
, they surely did some good games.AFAIK Elektraglide - this was quite

good on the ATARI 800.Or Jet Boot Jack.

>
> The main problem is, that we have lots of XEGS carts, but XEGS carts

> carts) which will be expensive or b) patch/upgrade the XEGS carts in
> such a way, they can be turned off which will be time consuming
> (testing...). Well, just wait and see what happens...

Yes , there are about 200 XEGS carts.Iï¿½d use them at first to "test"
if people would buy new released ATARI XE games.If this works,I can
search a company which produces new carts for games,more professional
carts for bigger and better games.
I think if I order 1000 or more,I can get a good price.

Because another problem of the XEGS carts is,that itï¿½s difficult to
open them without damaging the plastic.

I also have older ATARI XL carts , Millipede and Pole Position ,Final
Legacy and Joust.AFAIK these carts are only 8 or 16K , but may be used
for smaller games,too.

I also want to do this with ATARI 2600 carts.

Maybe weï¿½ll meet at this years JHV and can discuss this.

Yes, also my opinion.If you want to play on the "real thing",discs or
cassettes are to slow (and a 810/1050 takes too much space).
And collectors prefer carts,too.

>
> I asked Sega about permission for Space Harrier as freeware. The answer was

The only way would be to change the name and maybe some graphics.This
way,many companies who hadnï¿½t the copyrights released
similar-to-arcade games in the 80s or 90s.

> It'd need a HUGE non-standard cart too - bigger than the 128K carts. I
> estimate the game will take up 120K in its compressed form on disk, if it is

> work with 64K machines - so about a 256K cart.

This is not the big problem.I have maybe 200,maybe 300 carts.If my
plan is successful,no carts will be left until end of 2003 and then
Iï¿½ll find a company which can produce new carts.

The advantage is that theyï¿½ll look more professional,can contain more
data etc.

>
> So, it's an unlikely candidate at the moment
>
> Hope you can rustle up some more support elsewhere
>
>
> Chris
>
Ok , I think Iï¿½ll find enough "smaller" games for the carts I have
now.If this is successful, Iï¿½ll let some company make new carts and
then even very big games should be possible.

4493. Name that 256 colour picture demo

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-08 08:29:19 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <JPDe9.27869$t4.23022@nntpserver.swip.net>
Source record: 27764

One of the early 256 colour demo disks for the Atari contained three or four pictures with the following:

1. The face of a man.

2. A picture of a woman in a bikini.

3. The same girl but without the bikini.

About picture 1 - this menu choice and file was probably called "ICH", which I suppose was the demo author's word (in German) of "I", in other words the demo author himself.

I think each of these pictures were divided in to one luminance file and one colour file.

About picture 2 and 3 -they probably used the same luminance file but different colour files to give the impression of a change between a purple bikini in picture 2 and human skin colour in picture 3.

I think the menu choice for picture three was called "not rude nude".

Finally, here is my question: Does anybody know if this demo had a name and who wrote it? I have it on a 5.25" diskette, so I can probably upload it to a web location if noboby recognizes it be reading my description.

All facts about this demo will be appreciated.

Anders

I don't think I would spend a lot of effort trying to buffer the sector data for timing considerations. You have 16ms to get ready for the data transfer portion of the SIO - if the CF card is not available for more than 16ms, it is broken for sure. My CF cards run flat out at all times. During data transfer, you are really writing into a buffer in the CF card and you can just shove data in there whenever you want. I have tried it with no polling for ready at all - no problem. You can write the whole card worth of data just as fast as the Atari can push it down - no problem. Just check for ready at the star of the data transfer and go for it.

Now, if you insist on using all 512 bytes... you have to buffer. I only use 256 bytes and throw away half the card. Cards are cheap.....

Don't know if the manufacturer made provision for its use. The OS definitely will not find it when Basic or another normal cart is installed which would leave you to Poke your data there for safe USR(calls or tables, etc. Not sure about a boot into Dos; the OS might see it and locate the display up there?

i was wondering if anyone might have an ATR of this?

i would like to test my 600xl as it is faulty...
thanks all

Who was the manufacturer of the board? IIRC, Mosaic boards supposedly could use the extra ram as 4 banks of 4K. If it is a Mosaic, I might have some docs around here somewhere.

I seem to recall that some of the third party upgrades banked 4K of RAM in
the $C000 page of memory - you'd have 4x4K pages there. But I don't own
one of the upgrades, nor do I have the docs, so I can't help you there...

With 3.2f you always have to specify a destination-filename, even when copying to E:, S:, P: or whatever...

COPY D1:TEXT.DOC P:*

will work just fine...

Always thought all version had "RUN" as internal command (with maybe the exception of 1.1).
It's a pretty important one for
assembly programmers...

Hi,

Not to change the subject, but I'm very curious about something.
Let's say I have a SCSI card reader/writer (pcmcia), can this
be used with a blackbox and say a 256mb or 128mb pcmcia card?
I don't know much about the blackbox, if it auto detects the
drive geometry or if it has to manually entered.

Reason I ask is I use these on my Atari TT and Hades with
no special drivers, the systems see them as hard drives.
Literally plug & play, format the card and off you go.
These units mimick a SCSI hard drive.

If such a unit would work with a blackbox, with adapters you could
use smartmedia, compactflash, memorysticks, and such.

However, I think the CF idea is really cool. I've been following
the thread and I hope it turns out as cool as it sounds.

Hi,

I don't have the SALT but what's wrong maybe I can help...

Most problems I have seen:

- bad contact, clean the chip that are in a socket like ANTIC, POKEY, CPU
and PIA.
- when you have black screen no tv output, try monitor, modulator could be
broken, have this problem 2 times.... with 600XL and 800XL
- Replace RAM chips, I have had several times bad ram chips in the XL
series.
- When you could enter the selftest run the memory test, audio test

Source record: 27775

Hi,

> What if you didn't do DMA? I recall reading that you can stick a number
> into the GTIA register and make the entire player a certain shape.

Sure, the only problem is that you need the CPU cycles to do that. Most
likely, this will rule out playfield DMA as it steals too many cycles.
You can hardly write three or four color registers per scanline with full
playfield DMA enabled, and the limitations for players is about the
same.

So long,
Thomas

4504. USB (software wanted, hardware developer willing)

Howdy folks

I've found a hardware guru who is willing and able to work on a USB upgrade for the Atari. He has even found a chip that is easy to connect to the Atari (simular to his RTC, see Dan Vernon's site at http://www.retrobits.net/). If the chip (USBN 9603 by National Semiconductors) is easy to get and if somebody is willing to write the software, he's willing to do the hardware.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> effect is that there are more clock cycles available in the vertical
> blank period on a PAL machine (more blanked lines, slower frame rate,
> faster clock speed). Thus it is possible to write a vertical blank
> interrupt routine that has time to run on a PAL machine but not on a
> NTSC one. I don't know if anybody has actually done so.

What I keep asking myself is this:

PAL machines have longer VBI, but NTSC machines have more of them (50Hz vs. 60Hz). If 50 times a longer VBI is equal to 60 times a shorter VBI, would it be possible to have the software detect whether it's PAL or NTSC and spread the jobs it has to do in a VBI accordingly? I realise that graphics stuff needs to happen at a certain moment on the screen, but sound code could be spread, I guess?????

Hi,

This is the original memory upgrade from Atari. it has 8x 4164 kind of chips, meamd total of 64Kb. This is normal I think because the memory chips are only in 32K or 64K never seen 48Kx1 bit memory chips.

Secondly it's also printed on the board. I think the memory is disabled by default or not addressed.

TXG/MNX

If it connects directly to the SCSI bus and is SCSI-1 compatible, and it is detected by an ATARI TT, I don't see a reason why it
should work. The BlackBox reads the drive-parameters from the connected harddisk(s).

In case the thing requires a paritybit and/or termination-power (more like SCSI-2), take a look at this:
http://www7.brinkster.com/atari/pinouts.htm#parity

Well,
I thought that Uncon would take place in September - as every year. So I did not think it would be 30th august, 31st august and 1st september but a week later. Damn, I was wrong !! Ofcourse I will be there at ABBUC JHV in October (saturday 26 or 27 october). At the moment I have 15 mini-discs with atari sounds for you... For the Uncon I bought some sleeping bags, just weeks ago and packed everything I wanted to bring with me, now I can unpack everything again :(
Anyway - see ya in Herten !! -Andreas.

> in October (saturday 26 or 27 october).

I hope I'll be there too. I'll get the keys of my new house this Wednesday (11 September) so I hope I'm finished with all the work
I'll have to do over there... Just in case: I'm pretty sure TXG will go, so he can bring the stuff with him...

> At the moment I have 15
> mini-discs with atari sounds for you...

Ahh, more!?! :-)) I had plans to make MP3's of all of them, but with such many songs it'll take a lifetime to encode and index
them :-)) A very important thing right now is to find xxx-MB's of webspace without banners where it is allowed to place MP3's for
download...

>For the Uncon I bought some
> sleeping bags, just weeks ago and packed everything

I don't think you'll need it for the JHV :-)

Well,
it will not fit on the XEGs carts, because you cannot switch them off.
This means: As soon as you plug in an XEGS cart the area 8000-BFFF gets
ROM !! And I do have my doubts, that Space Harrier fits right under this
area. Thus you have to search for a cart (or PCB) schematic that can be
switched off via software and has more than 128k capacity. Nir Dary
designed such a schematic that has a capacity ranging from 16kbytes to 8
megabytes. I am currently thinking about producing such PCBs, if thats
not to expensive...

The other possibility would be to search for a way (patch / upgrade,
etc.) to switch off XEGS carts, which is not that easy... -Andreas.

Solution:
install a second PIA chip !! Then you can control up to 256 megabytes
(maybe more, don`t know). And if you still need more: install a third
and fourth PIA chip, etc. On the other hand, it will take quite a while
to fill so much space... -Andreas.

Well,
there are two versions of XEGS carts: a) Hong kong type carts and b)
Taiwan type carts. the Hong kong carts have a screw right under the
label. so all you have to do there is destroy the label (which does not
matter, because you will use a new label for the new game - won`t you?)
and open the cart safely. The Taiwan carts don`t have screws, they have
plastic noses - and yes they get broken if you open these carts (thats
why atari produced them! they thought if the users have to damage the
cart, they would not open more than 1 cart). But you can use plastic
glue to put them together again. I already have some carts here and they
look good (with nice color labels from Nir Dary)... -Andreas.

Well,
for the big games, there are only two ways possible: a) copy the game
completely into RAM (thus the game mustn`t be bigger than 64kbytes) or
b) use bank-switching. However if you are using already released games,
that came out as disks or tapes they don`t have bank-switching
techniques. One would have to rewrite/reprogram the whole thing which is
surely to much work. Just think about A.R. on cart, everyone would love
such a cart, except the one who has to reprogram all the code to get it
working as a bank-switching cart... -Andreas.

I have a factory machine tha use 1 Z80, 1 RAM, 2 Eproms, 2 CTC, 2 PIO,
1 display and some buttons.
I have read the Eproms and disassembled it.
I want to make a little modification to the program, it is just a value,
How can I make it, I mean how can identify the part of the programm I am
looking for, the program is too large and confused.
And I don't want to compile the code.

Please some one help me.

Thank you.

Kind of figured that. ;-)
The TT an Hades are SCSI-1. Cool, I will have to see if my friend with
a blackbox would be willing to test such a unit out.

Hi,

Why not add an SRAM to the cartridge, it should be possible when you can switch banks, to disable the ROM also. That means you could enable a SRAM on the same address space. If I am informed right it should be possible to create up-to 255 banks. Normal games use only 4 to 16 banks max. So there are some bits free to disable the ROM and Enable the RAM. You only should copy the data that is needed in the RAM area first to lower ram and then to the SRAM. But that wouldn't be hard I think.

"Andreas Magenheimer" <magea000@students.uni-mainz.de> wrote in message news:3D7CDE23.90664C86@students.uni-mainz.de...
Well,
it will not fit on the XEGs carts, because you cannot switch them off. This means: As soon as you plug in an XEGS cart the area 8000-BFFF gets ROM !! And I do have my doubts, that Space Harrier fits right under this area. Thus you have to search for a cart (or PCB) schematic that can be switched off via software and has more than 128k capacity. Nir Dary designed such a schematic that has a capacity ranging from 16kbytes to 8 megabytes. I am currently thinking about producing such PCBs, if thats not to expensive...

The other possibility would be to search for a way (patch / upgrade, etc.) to switch off XEGS carts, which is not that easy... -Andreas.

I would like to inform you that SIO2IDE version 4.0 with USB port will
be available in three weeks. Hardware is based on the ATmega323-8PC
and USBN9603.

Interface works in two modes:
- normal SIO2IDE mode like version 3.2
- IDE2USB mode (Mass Storage Class Device "removable drive")

Now you can connect your Atari HDD directly to the PC via USB!!!

4536. Re: Modify a Z80 programm on eprom

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-10 06:04:40 UTC
From: TXG <txg@the-underground.myweb.nl>
Message-ID: <alj2ds$19n$1@news1.xs4all.nl>
Source record: 27650

Hi,

First off all this newsgroup is about Atari 8-bit which uses the 6502c microprocessor.

But to answer your question:

When you have the dump from the eprom use a program like ultraedit (on pc) to edit it. You don't need to disassemble the code, just change your values at the address you want to. So the first byte from the EPROM would be address 0.

Then burn a new EPROM again and you're done...

Bob Woolley should get all the credit on the Megacart..
you are right rene. it is possible to do a cart up to 8meg (use all
255 bytes). and switch it off.. but if you did not know.. burning an
8meg eprom takes about 30min ;)

> Could the speed be upgraded? Maybe like Speedy HSS copy up-to 96000 ?

IMHO: No and you really hit the point of diminishing returns. Here is the thing, the SIO clock is derived by dividing the Atari system clock by a 16 and then by a 16 bit divisor. None of our serial rates are exact, i.e. if I have it right 19,200 BAUD is really 1,790,000/16 or 112,000 base clock divided by 6 to 18,667. 18,667/19200 => ~2.8% error. So anyway, you can get 112,000 divided by [6, 5, 4, 3, 2, 1] which would mean the next jump beyond ~57k would be ~115k.

A 2nd PIA chip would work of course but I think it is a little to much club
for the distance. There are other logic functions that could get the same
job done in less real estate and power. I remember doing a couple of chip
design around a 74LS174 6 bit latch that could have been done with single
piece of programable logic.

4542. yet another awesome NUMEN story

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-10 15:35:25 UTC

Source record: 27663

Howdy *.*!

Well everbody should know NUMEN. The most shocking xl/xe demo ever seen. Today I inspected the official disk of the Numen final version and found plain files on it with a short comment, that Numen will run from every dos. Well, it must be a joke, I thought and installed it on my SpartaDos3.3 HDD setup.

What to tell: It's running like a charm!! Without any problems the programm is loading from it's own subdirectory. Even storing the ramdisk setup-file is working perfectly.

Is that a new generation of compatibility? I would be soo wonderfull, if all programm just start from their own directory and after usage, return to operating system. I know, these are standards set by modern environments, but this is just so wonderfull to see the most complex demo programm running without any atari dos loading limitations.

Is possible, and very usefull...

When I do some programming I copy my own equates to the RamDisk, together with a BATch-file named "M.BAT". This batchfile just
loads MAC65 from the harddisk and the source in RamDisk. Since I allways name the source "Q" when working on it, the batchfile
looks like this:

```
D1:>MAC65>MAC65.COM
LOAD D9:Q
```

So when I enter "-M" at the commandline, the assembler will be started and loads the source into the editor...

4546. DGS/PPP Atari 8-bit CD - Summary of prices/contents

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-10 19:39:41 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1031687240.8637.0@eos.uk.clara.net>
Source record: 27669

Hello All,

As you may have seen from an earlier post, I have created a 'cut-down' version of the DGS/PPP Atari 8-bit CD-ROM containing just the DGS products. This new version can be sold to any country, including German-speaking countries. Below is a list of products included on each version. A * means it appears on both the 'full' and 'cut-down' version. A % means it appears on the 'full' version only:

% Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
% Quick Support Disks 1 and 2
% SAM (Screen Aided Management) V1.25i (80-col desktop system, similar to GEM - no additional hardware needed)
% SAM Budget (spreadsheet)
% SAM Designer (DTP/designer package with circuit diagram creation facilities)
% SAM Utility Extensions (conversion between SAM and non-SAM formats)
% 4 Power Per Post games: Rubber Ball, Glaggs It!, Bombi, Mine Sweeper
% QuickEd (Character set editor for mouse, joystick and touch tablet)
* Digi-Studio (digitized sounds/music utility)
* Issues 1-14 of our News-Disk on-disk magazine
* Issues 15-19 of the printed magazine carrying on from the on-disk mag (scans of the original mags)
* Issues 20-26(last issue) of the on-disk magazine carrying on from the printed mags
* News-Disk Yearly Disk 1 (disk to go with the printed mags, includes lots of Quick source code)

Prices are as follows:

'Full' version - for sale to all countries EXCEPT Germany, Austria, Switzerland:
US$15 by PayPal or cash
UK10pounds (by cheque for UK customers only)
EURO 15 in cash

'Cut-down' version - for sale to all countries:
US$10 by PayPal or cash
UK6pounds (by cheque for UK customers only)
EURO 10 in cash

For more info, and to order on-line using a credit/debit/charge card using PayPal, please visit the web site at http://www.dgs.clara.net and click the link to the CD-ROM page.

If you are sending cash, please e-mail me when you have sent it. I can then e-mail to let you know when it arrives.

I have so far sold 16 copies of the 'full' version, which means I'm still running at a loss. A few people have posted to say they have received their copies, and are happy with it. This should hopefully show that this isn't all a con, that the CD does exist, and I'm not trying to rip anyone off! Please have a look at the info on the web site, and consider ordering this CD. Thanks.

Dean Garraghty

4547. Atmel MPU for SIO2IDE

Hi,

115K can be done, some people I know in Poland build a drive that could
handle this speed only they could load with DMA turned off. But the High
Speed Sector copier in the Speedy for the 1050 uses really 96000 ....
How they done it I don't know maybe Floppydoc from ABBUC could explain...

I will post screenshots. The quickest solution for me is to take photos of the TV screen with my digital camera. This will at least give an impression of what the pictures look like. I have never tried my SIO2PC cable, but I certainly should, also for other reasons.

When I am done with the transfer of pictures to the PC, I will post a new article in comp.sys.atari.8bit.

I came across this in a google search.

>February 25, 2000. Lance Ringquist of Video 61 is currently working on a
cartridge
version of Ice-T. Progress reports will be posted in comp.sys.atari.8bit and
...

I hope Lance check to see if all the bugs where fix'ed first.
It would just be a waste to have a buggy Ice-T cart.
For Starts the Ymodem-G dont work, I reported this to Itay and had no plans
on fixing it.

If its bug free I will order one from lance cause the rest of Ice-T is
great.

I agree it sounds like a Technicolor Dream demo, but this demo diskette must have been created long before Technicolor Dream (the picture editor by Red Rad Software Ltd) became available.

The demo diskette I am referring to was sent to me by an Atari friend in 1984 or possibly 1985, while Technicolor Dream must have been released in 1986.

I always thought this picture demo I am thinking of was as well-known and widely spread as the demo with the spaceship and the robot. Apparently, my assumption is wrong.

Enough said, I have to find the diskette, start the computer, take a picture, upload it to a location on the web, and post an article in comp.sys.atari.8bit.

I'd understand if you wanted to convert Word files to Atari format, but
for the opposite, why not just read the text as ASCII text and have Word
re-save it in its own format?

Well, the big problem is that Atari 'plain text' files are in ATASCII.
The End-of-Line is different (Decimal 155) and would need to be converted
into the 'CR/LF' pair that MICROS~1 WINDOWS expects (Decimal 13, Decimal 10;
aka Ctrl-M, Ctrl-J, aka hex 0x0D, 0x0A).

Another problem would be any inverse-video text (again, if it's just a
"plain" ATASCII file, and not some 'binary' format, like AtariWriter,
where there's special formatting code & such intertwined).

The high bit (binary 10000000) would need to be stripped (after the EOF was
converted to CR/LF, of course!). It'd also be useful to make sure no
Atari ATASCII graphics characters (like CTRL-A through CTRL-Z) were left
in the file. They'd need to be stripped, replaced with placeholders
(like "??????"'s), or replaced with ASCII approximations.
(The Control-G character '/'-like shape could be replaced with a plain "/" slash
character.)

A simple Unix tool like "tr" could do most of this.
Perl could pretty much handle it, easy-as-pie, too, if someone bothered
writing something.

Of course, since they're trying to convert to Word (like you said,
we'd probably just convert to ASCII and load the ".TXT" in Word and
save it back out as a ".DOC" manually), I'm guessing they're using
Windows, not Linux.

There's always Cygwin, though >;^)

source into the editor...

but it won't compile wihtin command line parameters. I have thought in
a command line option like this:

d1:>mac65>mac65.com -a q.asm q.obj

to compile the source "q.asm" and store it as an object file in the
same directory.

My idea is: use your prefered editor (like Textpro) for doing the
source and after that compile it within the operating system. It's
just like programming linux or something, just split your development
into an editor and a compiler.

Howdy *.*!

Today I installed my new JAM!! converter to connect the atari computer
to my pc vga monitor. But I have several problems with it.

When I connect the vga plug to the jam device the jam begins producing
a droning and buzzing 50hz sound. I'm totaly frustated because of it.
So it's not very usefull at all, if I have no sound :-(

any suggestions?

If it is an ~90S8515 40 pin version and Jim's suggestion of Digikey doesn't work out, I have one.

I kind of like the people at Atmel and their processors. I didn't like their supply pipeline then and I am unsure about it now.

Original excuse was they were too busy making cell phone ICs to make processors. If I read the microcontroller group right, this led to numerous people chosing other processors.

Holy moley! So you do!

Hmmm! Only $19, too.

I'll need to strongly consider this. Anyone else here tried it?
Any limitations/problems?

I'd be using it with a stock Atari 1050 drive and SIO2PC/APE.

muttering about no APE for Linux

No need to worry, Bill, I'm already working on that.

Last time I tested my software even high-speed SIO (38.4 and 57.6)
worked for me, but currently there is not the slightest bit of
an user interface - not even command line :-)

I can't tell when the software is going to be suitable for a public
alpha test. Two weeks ago the harddisk of my testing machine
(a nice little '486 subnotebook) crashed and since then my computer
dealer keeps telling me "The new HDD will be there in - hmmm - two
or three days"... I called them today and - guess what - they
told me it will definitely be there on friday.

So I everything I hacked during the last 2 weeks is completely
untested.

OTOH - one thing for sure - the software will be fully GPL and
include an easy-to-use library for doing both SIO2PC and 1050-2-PC
stuff if you want to write some programs on your own.

Anyway, if you are interested in early alpha-testing, contact me
by email.

so long,

Hias

Can't verify it right now, but if the syntax was right it *might* work.

Or: if you run a BATchfile like this

```
D1:>MAC65.COM
LOAD Q.ASM
ASM,,D9:>Q.OBJ
```

it'll work I think. (note the double comma between ASM and D9: required to make it an OBJ/COM file)

Seems no problem for me, as MAC65 is able to read clean unformatted ATASCII without problems...

I've never done it so...but this should be the command line in SpartaDOS
to get it to fly. It is supposed to be able to do this, IIRC

d1:>mac65>mac65 asm d#:q.asm,,#d:q.obj

We have some older Atari equipment and would like to know if there is any market for it.

Samples of what we have: 800 Atari; 800XL Atari; 810 disc drive; 1050 disc drive;
1-27 printer; 1025 printer; various power units, koala pad, joy sticks, cartridges, and floppies with games.

Any advice you can give on this would be helpful. I haven't been able to find any
Atari resources in Kansas City, so we are hoping to find new homes for this equipment.
Thanks!

You're not the only one... I've written him several times asking about his NW Atari club... I wanted details about when and where to meet... He'd write me back with one sentence replies never giving me a straight answer and I'd never hear from him again... Yet he'd keep posting invitations on the NG's... What's up with this guy?!

I don't see what that has to do with what the guy posted, he was
wondering why Ben sorry BEN :-) didn't answer his question re an Atari
meeting place that Ben was himself talking about.

I'm not knocking Ben, just wondering why you are giving the other
poster a bit of stick re a perfectly reasonable question.

Btw, does flake equate to idiot?

If so that's a tad rude don't you think..

submit them here:
http://geocities.com/rtdos

i just had an awesome idea for a screen saver, maybe someone can help me, actually two screen savers:

1. the atari 1200xl bootup screen with the atari rainbow logo fading in & out (or maybe the atari fuji bouncing around the screen or the spaceship / robot demo) ? that would be awesome huh ?

2. the atari xl/xe self test mode as a screen saver (all tests option).

i'm just learning C++ or maybe i can use a *.JPG *.GIF compiler ?

Just a crazy thought, now back to our regularly scheduled service.

wow.. atari go you guys rip this up.. but if you look at the commie deal.. we should be ashamed. i am 33.. soldered my first joint in 16 years about a year ago. been into atari for about the same time. reemerged. sold my atari stuff when i was 17. now i have about 16 machines. i am pacing a steep learning curve and all you discourse in this thread is highly enlightening. i am back in this Atari world to stay till i am grey then gone. i am talking moregtia's antics.. overlays and .... i was laughed at when i said an atari on a chip.. but on a phreakhin commie board they were proposing just that.. we seem to be behind. i aim to build an 8 bit laptop or nothing. this cf deal is ideal.. he he ha.. i have so many machines.. and as far as the space..they pack tight...you only need a few ps's and all the other space and tedious mess fuss. i like all the ideas. i hate to see these commies making headway over us. we have allways ruled. period. now i have all the time i want and i aim to do my best to make atari a phenom. i cannot imagine a more astounding feat than to use basically '79 tech to outdo in relative terms things done today. use all new tech. but use it in a way that it is subservient to 8 bit Atari.. i have some funds to put forth to this effort. i want to bust open an atari laptop with my i-opener playing slave. i have read that the address space is there for many more chips.. i am low tech but driven.multiple pias gtias cf and antics.. whatever.. i have five years to devote to this endever ande a reasonable amount of money. you who know shut me up or raise this issue. let me know. i can devote some money to whoever plans to produce these projects mentioned in this thread. maybey if it is right and whoolly the man who seems to be leading or whoever fits this bill. shut me up or come get some funds. i can prob offer 500. out of line or in outer space i do not know where i am but from the commie boards i think my ideas have merit. proper nouns rarely sit solid in my mind so whoever has the ball in their court let me know. i am all about this. Atari has to pull out and boggle some heads. even if i have to do it all myself. but there seems to be a nice bit of enthusiasm here. i am offering locomotion.and just to put this on an even keel; if you can correct it it must be phonetic. i aim to communicate not impress or claim anything. please accept my NCV. neo-cyber- vernacular function not fasion i hope you all can feel me....

> Australia I wouldn't mind bidding on)
> 5) If your using the monitor out, instead of RF does the difference still
> apply?

The PAL vs NTSC carts is an issue with the Atari 2600 VCS, but on the
8-bit computers most software will run on both. It's not a Cart vs.
Disk vs. Cassette thing, its more to do with the software itself
(rather than the media). I've run carts purchased in NTSC countries
on PAL machines and viceversa.

It's software written in PAL countries that squeezes the timing to its
limits that gets into trouble and won't run on NTSC. Usually demos,
but there are games and utilities out there that won't work.

But just because it runs doesn't mean it will run the same, any
clocks/timers displayed by software won't keep to real time on the
other system, unless it has been specifically written to run on both
NTSC and PAL. Also games may run slightly faster/slower and hence be
slightly harder/easier (or maybe that's just me getting old =)

>the PAL machines run at at about 2.1 mhz while the NTSC ones run at
>1.8 mhz.

My understanding was that PAL CPU's ran at around 1.78MHz rather than
2.1MHz. There's an entry on page 117 of Mapping the Atari Revised
Edition (memory location 53268 - $D014) that states PAL 6502's run at
2.217 MHz, but other data doesn't seem to tie up with this.

As you say, the 6502 is sync'd so that 1 CPU cycle = 2 colour clocks.
There are 114 cycles (228 colour clocks) per scan line. NTSC has 262
scan lines 60 times a second, PAL has 312 scan lines 50 times a
second. Some of those scan lines occur while the screen is being
drawn and some occur during the Vertical Blank (Atari 400/800 Hardware
Manual, pages II.1 and VI.2; De Re Atari pages 2-1, 2-2, 5-4)

So for NTSC: 262 * 60 = 15720 scan lines per second
And for PAL: 312 * 50 = 15600 scan lines per second

NTSC: 114 * 15720 = 1792080 cycles per second (~ 1.79MHz)
PAL: 114 * 15600 = 1778400 cycles per second (~ 1.78MHz)

The timings in Appendix 3 of Mapping the Atari seem to agree with the
NTSC calculations too.

I'm not a hardware person though, and I don't know enough about the
nitty gritty details of how TV's work, so I could be missing
something. Am I making a mistake in the calculations?

>Thus it is possible to write a vertical blank
>interrupt routine that has time to run on a PAL machine but not on a
>NTSC one. I don't know if anybody has actually done so.

Yeah, I've done that =) *kicks self*

As far as I know, I'm in the guy trying to do the CF deal with Atari. My main issue right now is that I can't seem to locate a decent CF connector. The ones at Digikey don't really fit the bill. What I need is an edge connector that straddles the board with connectors on both sides of the board, lined up or staggered, I don't care. If the connectors are all on the same side (like the Digikey connectors), they're too close together for me (I'm not that good with a soldering iron).

I don't need money, I've got that. What I need is a CF connector that fits the bill. Once I've got that, I can complete the prototype board design and do a first run of boards.

Pete

http://www.aracnet.com/~atari/free_cat.htm How to Get FREE Catalogs
Check out my updated Atari Catalogs as I've adjusted HardWare Prices,
added some New item's and sold some more inventory. I mention this
because I'll also be adding more inventory to my Atari Catalogs!
http://www.aracnet.com/~atari/catalogs.htm Catalogs Area

FREE Catalogs for Used & New 64 Bit Atari Jaguar Game Machines,
Classic Atari 8 Bit & Atari ST Computers! HardWare/Accessories, Games/
SoftWare & Books/References! View Atari Catalogs on-line or DownLoad off
my WebSite at www.aracnet.com/~atari/catalogs.htm If you can't get my
Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's
not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or
Atari Jaguar! Or all 3! Then I'll send them to you by E-Mail Only. Not
Snail (Postal) Mail. Please let me know if I can attach text files to your
E-Mail. Catalogs are just regular ASCII text files so you can download
them into your text editor and view them, edit them or print them out! It
would make things easier for me if you take my Catalogs, load them into
your text editor, delete what you don't want and E-Mail me the rest! To
expedite things, include your full Mailing address so I can figure
Shipping & Handling. So E-Mail atari@aracnet.com or atari@benjamin.net!

For those of you who don't read your NewsGroups with a Web Browser!

http://www.aracnet.com/~atari/whybuyben.htm Here's the Winner!

Well, it's been a tough decision. Each entry looks good. But the winner of the "Why Buy Atari from Bravo Sierra Computers" is Reverend Tad Stinson! I chose Tad partly because He is a Reverend. Besides being a Professional Communicator who made the point quite eloquently! He has a unique point of view regarding the subject matter (Me!)! We get together once a week to eat out and come back to my place to play Atari! Were both avid Atarian DieHards and we speak on the phone nearly everyday. He knows me from a Point of view like no other! Still he gives me a glowing review. 2 Thumbs up! And as a Reverend, that adds a whole New dimension of credibility! As the Contest Winner, Reverend Tad Stinson receives the Cash Prize of $25! Anybody who's not persuaded by these, my Living References probably just refuses to believe! And for those who doubt the good Reverend! They have no Reverence for those who devote their lives to serving others! Whether as a Minister of the Gospel, or as a Dealer devoted to supporting Atari!

Contest Winner Listed Below:
==========

Dear Atarian,

Ben Smith is the greatest! I have been buying Atari hardware and software from Ben for over six years,and in that time have never been disappointed. He is always able to meet whatever Atari need I might have. He delivers excellent service, wonderful and useful advice, and sells his merchandise at a competitive, fair price. I have had the privilege of spending time with Ben at his home where he lives, eats, and sleeps Atari. He is without a doubt the most knowledgeable Atari expert I have ever met. If you are interested at all in Atari computers, I would highly recommend that you contact Ben Smith. He is a man of integrity, who can be trusted.

Sincerely,

Reverend Tad Stinson
Gladstone Oregon

Matthias sent it to me, and it's working pretty well, so far!

Much better than the poor, unfinished 'femul' program I tried before.
... Probably because it runs with realtime scheduling.

Very cool! Keep it up! Linux Kernel hackers & coders out there, let's help
him polish this up!

Oh my god - Do you know what would be awesome!?
Get your SIO2PC software running on the Sharp Zaurus PDA with its
serial connector.

Imagine being able to carry around 100s of MBs of Atari software in your
pocket, ready to connect to your 8-bit!?

>:^)

it's all about the money...

a company that makes pirating hardware does not like it's own medicine..

very typical.. i see this mentality perversly demonstrated throught our whole economy.

lol i guess it is the american way you best pirate right or you might not pirate tonite.. now you would have to search high , low, near , and far just to find someone who would want a copy of an 8 bit program. still they hold on. imagine what it would be like if people were open and promoted and actually welcomed innovation. we would be fathomes ahead in every aspect of industry. the best teachers learn as much as their students.... now who said pay me firstllibsetag.. stifled for cash.

anyway i am just a nut from california.

>
>So for NTSC: 262 * 60 = 15720 scan lines per second
>And for PAL: 312 * 50 = 15600 scan lines per second
>
Actually, those numbers should be 262,5 and 312,5 - the half-lines either
beginning left of the screen and ending in the middle or beginning in the
middle and ending in the right side.
So:
262,5*60=15750
312,5*50=15625

And since 60 is not really 60 but 59,94, it becomes 15734,25 (actually,
15734,264 since even the 59,94 is rounded)

>NTSC: 114 * 15720 = 1792080 cycles per second (~ 1.79MHz)
> PAL: 114 * 15600 = 1778400 cycles per second (~ 1.78MHz)
>
the 1,79MHz should actually be 3,579545/2, or 1,7897725 (this value
is even confirmed in some Atari manual, IIRC)
For PAL-M, it's 3,57561149/2 or 1,787805745
That's becasue the frequency of the color subcarrier for NTSC is defined
as 455/2 the line frequency, while for PAL-M it's 909/4. Oh, and PAL-M uses
525 lines at 29,97fps as NTSC (which, properly, should be called "NTSC-M",
in fact)
For PAL-B/G/H it's 4,43361875/2 or 2,216809375 since the multiplier is
(1135/4 +1/625)

However, according to the 800XL schematics, non-NTSC machines used an additional 3,546894MHz crystal (aside from the 4,43618 one which is removed on NTSC machines) instead of the 3,579545 one. The 1,77MHz signal goes to the CPU, the 2,21 one to Antic and GTIA, since the CPU can't take more than 2MHz.

> Oh, and PAL-M uses 525 lines at 29,97fps as NTSC (which, properly, should be called
"NTSC-M", in fact)

Untrue. PAL-M is just PAL with higher framerate. NTSC is completely
different (I mean color encoding, where is pal clearly superior).

> However, according to the 800XL schematics, non-NTSC machines used an additional
> 3,546894MHz crystal (aside from the 4,43618 one which is removed on NTSC
> machines) instead of the 3,579545 one. The 1,77MHz signal goes to the CPU, the
> 2,21 one to Antic and GTIA, since the CPU can't take more than 2MHz.

To be clear:
3,546894 MHz goes to ANTIC & GTIA. To cpu it goes divided by 2.
4,433618 MHz goes only to GTIA, because it's used as color burst signal
- can't be derived easily from main clock as in NTSC machines.

Source record: 27574

Howdy folks

Were the Proceed and Interupt pins on the SIO port ever used?
If no, why not?
Could it be that Proceed is to one PIA port, what motor on is to the other?

You really are not helping the situation, contrary to helping Ben you
are actually stirring up more people with this rambling nonsense.

Insulting and attacking others with words like ass whooping and butt
head (very Springer) are NOT in the Atari community spirit and Ben
would agree with this himself.

Those that don't like Ben's adverts have the option to kill file them,
if they don't then they can't really justify continued attacks. Those
that support him can do so by buying from him and wishing him well as
most people do including me. Personally I wish Ben would put ADV: or
COMM: in front of the adverts as I don't read adverts in any groups I
am in so if I kill file Bravo then I won't see any non advert posts
from Ben..

I certainly won't lose sleep if he does not use those prefixes and I'd
rather have a bloke making a living AND keep the Atari alive any
day...

What we don't need is calling people English stiffies etc, that's
turning it from Atari into ignorance and throws you into the spotlight
as the bad party.

Please just get on with loving the old Atari like the rest of us...

Howdy folks

I lost the link to the 1050 Duplicator site. Could somebody please tell me where to find it?

BTW how good/bad was the Duplicator (I know the ads where HAPPY told everybody it's products were better, but I'ld like to hear from users)
What happend to the software they mentioned in the 1050 Duplicator ad?
What was the real difference between the duplicator and the other 1050 upgrade mentioned in the duplicator ad?

How much more expansive is the Atmega323 as compared to the
Atmega161/Atmega163?
If you add an extra USBN9603 you can have two USB ports. If they could talk
to each other without the Atari doing anything, networking on the 8 bit
Atari would be easier.

Follow the link at the bottom of this message...it will take you to my
website. You will find a link on the homepage to my Atari page.

> upgrade mentioned in the duplicator ad?

How good was the duplictor? Well, I can sort of answer that question.

The biggest problem was that the company that was selling the duplicator
made a few boo-boo's. The biggest one was putting the ads in the magazine
before it was even finished, and as the one who was writing the code for the
thing, I was forced to wrap it up pretty quickly so they could start shipping.

As purely a drive enhancement, it worked pretty good. With the correct
dos, like sparta dos, it could really fly compared to a regular drive.

But as far as it's ability to duplicate copy protected disks...it could do
the simpler ones, but things fell apart before any of the more complicated
schemes were gotten around to. For the whole project, I ended up making about
$4.50 and hour.

H&#65533; Vidar! I noticed you a few times before. Still one of the die-hards eh?
:-)

Just to get rid of any rumors I place this in the group:
No, I don't expect to finish MegaZine #8 any time soon.
Actually I just have to get "in the mood" to finish it, since there's only a
few days work left.

I almost decided to put the articles on the web, but I still like the idea
of a last bootable one.
Maybe sometime, when you and me least expect it....

Best,
Freddy.

The posts in question were almost two years old... I take it the club was going strong back then? But I wouldn't know because I never was able to get information as to where to go and when.. And then there was another post pertaining to a night to get together and play on the console systems... I wrote back saying I was interested but received nothing but a one sentence reply saying "I'm working on it" or something to that extent... I answered another one a couple of months later and received the same reply..

So trust me man, I wasn't the flake here.. I mean, I'm not questioning his business ethics or anything but I don't know, maybe I would have bought some stuff from him if these meetings took place?

Ben,

Thanks for the reply but there's no way I'll be able to organize meetings with my schedule.. And I'm not that knowlegable with the ST line... That was one of the main reasons I wanted to attend so I could get to know the computer better... However, if you're still doing the console thing, let me know..

Thanks,
Trip

Both lines are rigged as interrupt sources thru the (IIRC) sio
hardware. I think the intent was to allow peripherals to signal the
Atari when some kind of service was necessary. From the names of the
signals, it might be the designers were thinking of some kind of
bus-locking scheme where a peripheral could take over the bus for
something. It might be possible to rig a token-ring style network for
multiple Ataris via SIO.

What is in store for real.dos. Currently I have two version in mind. version One will be for use with emulators. I have a routeen that was added to x3.3b and x3.3c that pole the computer that it is running on and set up the ciov handler. According to Tom hunt the ciov routeen in x3.3a that was written for mux systems works the best with emulators. Version 2 will be for use on real Atari Hardware. Currently I need to do some updated to the polling code for the mio. I want to also updated a number of thing one of them will make real.dos work with PAL and NTSC machines with out modification. I am also looking at a routeen that will swap the program you are running with an image file that is located on the harddrive. IF someone out there have other thing they would like to see please e-mail me. Now to answer the Big question why I am doing this. Bob Woolley and myself have designed a new hardware device that has 512k of battery backed up ram, a Programable OS, AN IDE controller, And hopefully a fully programable cart, And maybe a Clock function as well.

Oh one last note: I received an e-mail of a great big list of things this person wanted in BBS Express Professional. While I will be makeing changes to PRO so I can put it on the INTERNET for my use. I will not be putting anything new for pro out to the general pulic. I will be giving updates to my friends but they will not be for sale. I have SOLD my part of bbs express professional so I have no way to know if a person is a true owner, I beleive that Pro is still sold by Lance, so he is response ability to provide updates. So bottom line is I will not give source or compiled code out to anyone. I also have the source to the Express Cart. FTE purchased it from Keith Ledbetter. FTE asked me to make chages to it and never paid me for it.

IF you have any questions or enhancments to real.dos you would like to see e-mail them to me at SJCARDEN@BELLSOUTH.NET

Thanks and have a good day, Steve.

Oh By the way my bbs is on line again with a new phone number. (706)790-9520 300,1200,2400,9600,19.2 usr duel Standard.

<DISCUSSION>

Why all this replies?

Just let Ben post sometimes his ads here, that's much better then all this other porn/warez crap I get in my newsgroups.

Ben still supports the Atari and as I believe is still someone who is honnest. So just give him some credit for that. When you don't like it, just ignore the ads.

A long time ago..and I mean a LONG time ago, there were several Atari groups in the Portland area.

Myself and a few others got together and attempted to bring all these groups together under one single body. I think we called it the Northwest Atari Treaty Organization (NATO). I was much younger then and not as creative with names (can't say I'm any better now).

The leaders of all these groups felt threatened that we were trying to take over their groups and toss out their leaders. Quite the opposite - we were attempting to unite all the groups together to form a stronger presense in the Portland area. I believe had we been succesful, the fate of Atari Corp, and it's followers may have been somewhat different or at least delayed - maybe not.

So, given what you've heard from your inquiries and knowing a little about the past representation of the various Atari groups, I'm not surprised by the one liners and lack of more enthusiastic replies. I didn't find the Atari group representatives to be very skilled in the areas of social interaction.

I gave up the NATO idea and sold my 16 bit Atari and moved to Mac platforms. Later, I switched to Intel architecture where I remain.

Users groups at one time offered a great service to the community. Under strong leadership, they offered new users a "warm spot by the fire" so to speak and helped educate them in the basics of the system they chose. There was decent social interaction - I actually made a couple life-long friends from my involvement in the Commodore users group in Eugene, OR.

Any more, tho Intel architecture dominates and folks can get as much information from the web or from newsgroups such as this. Additionally, they can turn to Ebay for all their trading needs. Sadly, the PC user groups are falling by the wayside. I'm sure Ben's doing a good job

trying to keep this alive, but eventually good intentions must give way to reality and he needs to eventually face the fact that the Atari market is dwindling and unless a developer is really doing this out of the goodness of their hearts - hardware and software advances are going to eventually stop completely.

I'm not sure where I'm going with this, but I've seen these Atari posts regularly, and while annoying, you can't deny a person free speach. You My newsreader (X-news, it's great stuff) has an easy-to-use filter and I put it to good use. Folks not interested in seeing this stuff might do the same.

At any rate, that's Zammer's history lesson for today. Sorry it was lengthy, but hope it's of some value.

Zam

I don't know what you're talking about, maybe you misunderstood me. I said that *NTSC* should be called "NTSC-M", strictly speaking, because it also uses the M norm for the picture (and the NTSC system for the color encoding, while PAL-M uses PAL for that). There's also an NTSC-N combination, but right now I can't remember where it's used or what for...

>> However, according to the 800XL schematics, non-NTSC machines used an additional

>
>To be clear:
>3,546894 MHz goes to ANTIC & GTIA. To cpu it goes divided by 2.
>4,433618 MHz goes only to GTIA, because it's used as color burst signal
>- can't be derived easily from main clock as in NTSC machines.
>
Well, the schematics I've got aren't too clear (it's a copy of a copy of a copy of a...), but it looks like a line goes both to ANTIC and GTIA (as ph2 in both cases) from the circuitry with the... right, that line isn't it, looked like it because that's where the schematic is broken. Now I've been able to folow it more carefully

Found it. NTSC-N is used in Bolivia and Barbados, PAL-N is used in Argentina,
Uruguay and Paraguay (which brings up the question, since I remember somebody
from Argentina posting here, did their Ataris had different crystals inside?),
and PAL-M only in Brazil.

Also, back to your comments, well, yes, PAL was designed as an evolved version
of NTSC to correct the phase-shift problems that sometimes occur in NTSC (and
that's why NTSC receivers need to have "tint" adjust controls); according to
PAL-advocates, NTSC meant "Never The Same Color". But PAL works by averaging
two consecutive lines (based on the fact that statistically, a screen line
won't differ much from the previous one), having the color subcarrier's phase
switched each line (so a positive phase shift in a line would be followed by a
negative one in the next), and requiring a 64ms delay line to store the
information for the averaging. Since the extra circuitry makes PAL receivers
more complex and hence increase their costs, NTSC-advocates say that PAL stands
for "Pay for Additional Luxury". (of course, neither does really mean that...
NTSC= National Television Standards Committe, PAL= Phase Alternating Lines)

Gawd I hate it when people can't even get their Fact's Straight here,
I have sit back and watch you threaten to take things into your own
hand here and sue this person and that person.

The Time has Came for you to learn something here Before you Release
a Cart or Disk Version Dos that really causes more harm then good...
First of all I spent more then Three Months at Stephen J. Carden's
House helping him Test out X33A, X33B, X33C, and X33D and I bet you
don't even know why they was even made Or what all they do. A was
Alpha, B Was Beta and C was for BBS PRO which By the Way would Run
Like a Top... Now D came because of the problems with the MIO running
the previous Versions and BBS PROfessional... Now if You check your
Records since you are the New Owner of BBS Profession, I was and had
been running the BBS PRO support Board for many years... Have seen
alot of people come and GO just like Mike Homan of FTe which btw I
went and spent one mothers day down in San Cruz setting up his BBS...
Was there when he released SpartaDos as Public Domain... So what you
bought has already been Release as PD, that included X33A thru X33D so
now how the heck can you sue someone over what was Release way before
you even came into the picture? You can't... Well you can but
collecting is like trying to Sue Bill Gates over Windows... (Grin) BTW
I also have a copy of the Source Code and was given it by Both Mike
Homan of FTe and Stephen J. Carden whom I did alot of work for as well
as Bob Klass... The Diference in the three was this... Mike Dreamed
alot, Klass tried alot, But Stephen Did it all... Just ask around and
you'll find that the Man is a Man of his Word...As I'm sure Ken Ames
has already told you... Or Perhaps you would like to ask Bob Woolley
as he has done more for Atari 8-bit and owns the saying Atari Rules
then anything I have ever seen come out of Video 61... Good luck with
you Cough Dos Cart as I'm sure people are already beating down your
door to get it...

Lyle Earl
Owner of PRO node 320

Hi!

Some did not understand!

My mactool program is completely FREE.

E-mail me if you want it.

Marius

p.s. Mactool works fine with DOS XL and Spartados. With the tool you can switch very fast to Mac65 without losing your list and you can cold boot without switching of your Atari. (Even with an atari that is frozen)

Look its people Like Lance who are Trying killing the Atari 8bit by
making statements he did to Ken Ames and Stephen Carden... I was only
trying to clear up what has been in Pass development and also letting
Lance Know there was some Serious BUG's in some of the versions...
After all I was a Main Beta Tester for BBS Professional and found many
of the flaws myself... No One heard about them cause it was between
myself and the main Programmer the way Beta Testing is suppose to
be... IF you are running a Black Box I suggest you run X33C.DOS Disk
Version as it will run BBS like no other DOS Around... IF you are
running an MIO you will Want to Run X33D.DOS... Both was Written By
Stephen J. Carden and Not Lance or Video 61... Sorry Lance but you
fully need to Beta Test your Sources before you go and write anything
and tagging your name onto them... Bet you don't even know what IFYB
Version was all about...

Since you are an Atari Fan you may want to contact Bob Woolley here
in Alameda Ca. as he has been working on the use of IDE drives with

his Stock Pile of 1200XL and other Systems... Something Mike Homan could only Dream of...

BTW since all this has came up I am strongly thinking of putting my BBS back up so those who want the REAL DOS can get it and not an imiation...

well it looks like its pile on lance day huh lyle earl.
trolling for someone huh?

Look its people Like Lance who are Trying killing the Atari 8bit by making statements he did to (Ken Ames)

(i bracketed kens name because he is the real untold hero here. i know full well what happened to him)

and Stephen Carden... I was only trying to clear up what has been in Pass development and also letting Lance Know there was some Serious BUG's in some of the versions...

(BUGS in computer software, OH MY GOD WHAT IS THE WORLD COMING TO! thank god you told me, i was unaware of bugs in computer software, all along i thought that was a rumor, it kept me up at nights, thank you for setting me straight. now i can sleep at night with the knowledge that its true.)

After all I was a Main Beta Tester for BBS Professional and found many of the flaws myself...

(WOW a flaw finder, hey i have done that to, i must be real important now.)

No One heard about them cause it was between myself and the main Programmer the way Beta Testing is suppose to be...

(well now we know, WHOOPEE)

IF you are running a Black Box I suggest you run X33C.DOS Disk Version as it will run BBS like no other DOS Around... IF you are running an MIO you will Want to Run X33D.DOS... Both was Written By Stephen J. Carden and Not Lance or Video 61...

(anyone who knows me knows that i am not a programmer, and i have never stated i was. infact right here and know i will say that I AM NOT A PROGRAMMER, where did you ever get a stupid idea like that.)

Sorry Lance but you fully need to Beta Test your Sources before you go and write anything and tagging your name onto them... Bet you don't even know what IFYB Version was all about...

(F*** your buddy you shit head)

Since you are an Atari Fan you may want to contact Bob Woolley

(i know bob wooley, hey bob you still got my check for the ads in atari classic)

here in Alameda Ca. as he has been working on the use of IDE drives
with his Stock Pile of 1200XL and other Systems... Something Mike Homan
could only Dream of...

(put it out on the market for all to buy, i will even consider it.
infact where is all of this sutff, i would love it all to come out, it
would make my business, and life much easier.
it would breath new life into atari, and it would be easier on my bank
acocunt since i seem to be the one of the few willing to put there money
where there MOUTH is.)

BTW since all this has came up I am strongly thinking of putting
my BBS back up so those who want the REAL DOS can get it and not an
imiation...

txg said,
About PRO! updates, I think since PRO! 6.0 ONLY RUNS ON EMULATOR... WE
ARE
STILL WAITING FOR PRO! 6 FOR AN REAL ATARI!!!
I am one of those people who registered BBS Pro! 5.0b and want to
upgrade when possible without leaving the original platform (atar 8-bit)
where this program was written for and being used.
Lance is a nice person, who still supports Atari I think but in case of
BBS Pro! I wonder how many copies he sold after BBS Pro! 6 came out and
how many copies of BBS Pro! 5.
Maybe lance can tell us what updates will be released in the near
future...
TXG/MNX

i feel that there is no one who will code for this porgram anymore,
there is just no money in it, and i have to pay the person/s who will do
the programming, after all they will not work for free.
if enough step forward for updates i might look for someone who is
willing to take the chance.
thanks,
lance

This is really just a small fragment of Bob's work. I lost most of my SLCC
newsletters over the years. There were a huge number of hacks in there like
a dual GTIA<or was it ANTIC?> with its own ram system, 6545 based 80 column
display adapter. I believe the Inovative Concepts XF551 to 3.5" upgrade was
essentially Bob's modification of the XF ROM.

There is really to much to remember. I think Bob did more in any given month
then I did in ~5 years of hacking Ataris.

Mike Homan is far out of sight. Bob Klass sold his rights, but Stephen is still around (or returned, whatever). It's just a
matter of changing two names (what's in name) and it's all solved.

"Mike" will be replaced by "us", the ones who're using Sparta-Dos (and/or Pro-BBS) and "Bob" will be replaced by "Lance". An
updated sentence of the quoted part above would now read:

"The Diference in the three is... The scene dreams alot, Lance tries alot, and Stephen does it all..."

OK, some small points if you will.
> (i am not bad mouthing bob wolley,

You did make a snide remark about paid for advertizement in Atari Classics.
You really have to understand that Jim Hood was really the go to guy for
getting AC published. I am sure he had no intention of dying of cancer when
he took on the job, it just happened. All things considered I really think
he would have prefered living and publishing AC. I still remember some of
his humor and deportment at SLCC meetings and in the newsletter. We could
use a man like him now.

> but the bozo earl fathead is bragging
> about all of the development going on.

There's a saying "When the green flag drops the bullshit stops." Trust that
a lot of people live by that.

> bob is a great hacker i am not trying to take any of his thunder away.

He's also a pretty decent, reasonable human being, and approachable. Must be
a thousand ways you can work with Bob vs a snide remark. Offer to do the
publishing/DTP for AC, exchange rights for his 80 column mod for AC
advertisizing you paid for.
> but the earl creep is suggesting that he is in with a group that is

(yes i to knew jim hood, and i was sad to see such a nice person pass away . bob did not send me my last ac classic he did. i have asked for it repeatedly over the years, and i understand that it was a lot of work to publish it, and it is really no big deal.
it was just my way of saying hello, if i offended him/you, sorry.)

There's a saying "When the green flag drops the bullshit stops." Trust that a lot of people live by that.
He's also a pretty decent, reasonable human being, and approachable.

(yes he is, i never said he was not a decent human being. the problem with the net is that two much gets read into one sentence, so let me say this again, its not about bob wolley, earl jerk brought him into it, i was just teasing a little about ac classics.
i have talked to bob before over the years, and he is really good, but i work with others at a different pace, and i am comfortable with that.)

Must be a thousand ways you can work with Bob vs a snide remark. Offer to do the publishing/DTP for AC, exchange rights for his 80 column mod for AC advertisizing you paid for.

(see above staements.)

Really, don't let it bother you. Isn't worth a second of your time to get upset about.

(what bothers me is that i really make very little money on new projects, infact most of the time i lose. sometimes i just have to defend myself.)

Hi! Lance,

I for one am glad you are hanging in there. When I heard that Klaas hold sold BBS Express Pro to you I was very happy. Also when you sent me a cart of x33c.dos and asked me what I though of it. Well for me putting the dos that Kenny and Myself have worked on was flatering. I told you then and I still feal this way, if you can sell the cart go for it. I want you and the rest of the WORLD to know that I am not angery with you and if I need a piece of Atari equipment I would call you. The ATARI world need to relize you did a very good thing. ANYONE that doesn't have SpartaDOS X or SpartaDOS x3.3c on cart should get one. Here is why, If for some reason the dos you are running get's corrupted only a CART based dos will bail you out. And anyone who programs knows the value of testers.

Currently BOB Woolley, Ken Aimes, Lyle Earl, and myself are working on a hardware mod for the 130xe. It will have a programable OS, Battery Backed up ramdisk, Programable Cart, And maybe a time clock. Oh Almost forgot it also has an IDE controler on it. It works with the Black Box, the MIO, and the KPI, Mux. This board we are working on is the reason I have desided to do some more work REAL.DOS. To give you a little history REAL.DOS was born when I was not paid for the work that I did for FTE. And just so you know BOB Klaas never paid me for the registration of the arc routeens from S.E.A that are in the BBS Express Professional. I kinda would have likes to get 10 cents on the dollor I saved sysops with those compression routeens. Any Way I don't like to see you picked on. You have a company and the focus of that company is to make money and I wish you well.

Lance Drop me an e-mail or call me voice.

Steve

About PRO! updates, I think since PRO! 6.0 ONLY RUNS ON EMULATOR... WE ARE STILL WAITING FOR PRO! 6 FOR AN REAL ATARI!!!

I am one of those people who registered BBS Pro! 5.0b and want to upgrade when possible without leaving the original platform (atar 8-bit) where this program was written for and being used.

Lance is a nice person, who still supports Atari I think but in case of BBS Pro! I wonder how many copies he sold after BBS Pro! 6 came out and how many copies of BBS Pro! 5.

Maybe lance can tell us what updates will be released in the near future...

>To stretch this discussing some more: what about the SECAM systems as used in France :-)

Well, SECAM (French for Electronic Color System With Memory or Systeme
Electronique Couleur Avec Memoire) was designed as an alternative to NTSC's
and PAL's problems with the chroma info sometime interfering with the luma info
by transmitting the chroma not as another QAM modulated signal with its spectrum
"interlined" with that from the AM luma signal, but rather as FM-modulated info
alternately sending one of the chroma vectors in a line and the other in the
next (thus also avoiding the trouble of the quadrature), and each of the two at
a different frequency.

"PAL" usually is used to refer to PAL-B/G/H/I, all of which have very similar
characteristics, and "NTSC" usually means NTSC-M, since it's the most widely
used combination. Other variants are refered by the whole designation (like
PAL-M, PAL-N or NTSC-N, already mentioned). SECAM-B/G/H/I of course use the same
values regarding the luma signal as the equivalent PAL systems for those norms,
and SECAM-D/K have a few little differences, as does SECAM-L. Most noticeable
is the video bandwidth, which for M/N norms is 4,2MHz, for B/G/H is 5MHz, for I
is 5,5MHz and for D/K/L is 6Mhz, and the frequencies for the FM-modulated chroma
components in the SECAM system are 282 and 272 times the line frequency (giving
4,40625 and 4,25MHz, respectively (a SECAM-M variant uses 3,493007 and 3,382MHz
instead - or at least, that's what I was taught several years ago)

I haven't seen the layout of SECAM Ataris, so I don't know what's inside them...

I don't think there's anything all that impressive about being
"hardcore", nor do I think an Atarian need be exclusive or else be
considered a "sellout".

All.....beware of the Ebay Seller groovyfun. I purchased an Atari 800 system from her which she advertised and tested and working. Notice she said system. Well, it wasn't much of a system, as there was no power supply. When I question her on it, she said, well I tested it with my power supply, but you can buy one here, and pointed me to another Ebay auction. Of course, it was for a Atari 5200, which isn't the same supply as a 800. Guess I should have known better, but thought I would warn the rest of you.

She's also the type of Ebay seller that won't post feedback when you pay her, she waits until you give her feedback, so she can give you negative if you give her negative.

I'm cross posting this to comp.sys.cbm, as she has Vics and Commodores adverstised as well. Be careful....and long live the 8bits :).

This sort of behavior in my opinion well merits a formal complaint
to eBay Safe Harbor.

>No offense intended, but that's a very misguided statement.
>
>Mike

Mike,

It was a very compact statement in all honesty, I didn't want to
expand on it that much.

Of course you can sit and voice your disagreement of the adverts, you
can do that all day and no, there's no law saying you must kill file
him.

But...It's the sensible thing to do isn't it?

Ben posts adverts, he's unlikely to stop while he's making money. You
voice your opinion which is your right, but in the end it all becomes
very circular. The struggle you have is that Ben IS supporting the
Atari people and his adverts will not be seen as wrong or Off Topic in
here so you are already on an uphill struggle imho.

Hence I said it's hard to justify attacks as he is both on topic and
doing something for this community so the option to kill file is the
best idea...in here....

My only annoyance in this 'Defend Ben / Don't Defend Ben' issue is
that some people are taking it a little too personally. Solars set of
posts were well meaning but were attacks on people. BUT I'd suspect as
others did that he / or she might have had a beer too many which I
respect but beer and NG's don't mix well :-)

Lets keep this all civil, people bringing a person's nationality in to
it is plain stupid. The ability to enjoy your Atari has no borders nor
does it have any colour or creed. The only problem I have had with
Ben's posts have been the wording on a couple of them which we spoke
about via email (no abuse from either side) and the fact I'd prefer
them to follow Usenet guidelines with a COMM: or ADV: so I can kill
file the adverts and not him personally.

Hi Lance,

> i feel that there is no one who will code for this porgram anymore,
>there is just no money in it,

Are you willing to sell BBS Pro! to me?
In the time BBS Pro! was for sale I and also a friend of mine, did also make a bid to Bob Klaas to get the rights of Pro! but at the end you got it.

> i feel that there is no one who will code for this porgram anymore,

That's why I did write this message...

>there is just no money in it, and i have to pay the person/s who will do
>the programming, after all they will not work for free.

I know, but we would like to dig into it and make our fixes / update for Pro!

>if enough step forward for updates i might look for someone who is
>willing to take the chance.

How many people do you need then? I think the active Pro! users are just a few maybe 4 or 5 people, so would you consider to sell it to us?

BBS Pro! 5.0b is the last version for us, the 6.0 ended up as an emulator version so it doesn't count for us. We would like to see an updated version Pro! 6.0b...

Just contact me private when you have something about this for me...

What's the auction number? I'd like to see the posting before I pass
judgement on whether she's scamming you or not.

lyle said,
Dang Lance such language and such a fine place...You talk like you are on a Smut board which you're not... Better kill the name calling here as it isn't needed nor will I put up with it or the foul language thru out your posts on myself... You CAN be Banded from these Boards for such... So lighten up and mellow out before you endup with a drinking problem dude...

(it was the way you posted that bothered me. you are carrying someone else's water here. i have already talked to ken ames, and i know the history of sparta 3.3c, and ken did have a gripe. there is someone else here that has used you, and ken, and maybe others for there own benefit.)

Lets see you have called me Bozo, Jerk, S*** Head... Did I leave anything out? Lance you sound like you are a two year old who IF he doesn't get his way he starts to Stomp his feet and throw a fit...

(please talk to ken ames, then maybe you will understand why, you are being used by someone that likes to make trouble, and i am tired of it.)

You call people Hackers and so on... I guess Atari, IBM, Apple and all the other Companies and people who worked for them are only Hackers...

(that is not a bad name or slam, gee the activision game hackers was cool. they even made a movie clalled hackers, and sneakers was a neat movie with the same connotation.
i wish that i was a hacker, then i could save lots of money/grief/hair/etc.)

It what you sound like... Maybe you should go on Vaction for awhile and get away from it all as it sounds like you are Stress to the Max...

(yes i am, if you really knew what you were doing when you made your first post you would understand.)

Dang I used to be just like you But I grew up and learned to enjoy life... But IF the truth hurt I am very sorry Dude... But I never troll for anyone...

(i did not enjoy saying what i said, so lets start over ok?
i am sorry that i offended you.
and i am sorry that this went so public i apologise to all.
but you need to talk to bob klass, and ken ames, then you will understand.
this has been going on now since the late 1980's, bob and i are sick of it.)

Now I will leave the rest upto you as IF you want to get into a Mud Slinging and Name Calling contest or even Physical here, Well lets just say I have played with the best of them...

(you probably have. but please contact bob klass, or ken ames.)

Why not sell the source for it (BSS Pro 6.0) as well as the executables,
make it open-source so to speak.

I have made a committment (to myself) to code a partition manager for Bob's SmartIDE mod. I've already put several weeks into it, and it is basically done... just waiting to be tested on a real SmartIDE mod. I haven't made mine yet.

Out of all the IDE mods out there, I like Bob's the best. It's simple and the writable OS is a nice feature. The MyIDE project also sounds nice though-especially for the cartridge connection.

I'm eager to see his 16-bit version, and this wonder-board that Stephen Carden mentioned.

Well, this project is dead for the moment. I can't seem to find a distributor for the proper type of CF connector. Without a useable connector, there's just nothing I can do. What I need is a connector that straddles the PCB, with 25 connectors on top, 25 on the bottom. There are plenty of manufacturers, but I can't find any distributors that will sell in the numbers I'm looking for.

If anyone knows of a source, I'd appreciate the help, as I'd love to do this project.

The only connectors I've been able to find are surface mount, with all 50 pins in a row, so close together, I'd never manage to get them soldered to the board properly.

If anyone has any ideas, that would be great. Otherwise the project is on hold.

Pete

Yeap. I still remember the cover during the Gulf War when everyone was so wrapped up in the politics: A picture of Sadam in a Butch Cassidy and the Sundance Kid take off that had Sadam with a bubble over his head saying "Who are these guys?"

Another one had Wooley and someone else who I can't recall at the moment on the cover, Wooley being an 8 bit supporter and the other member an ST fanboy. The caption was something like "Seeing into the future" with the 'dream bubble' above the ST fan ~a mega ST and the bubble above Wooley being ~a 1200XL.

At the time I was doing more then an occasional rant about how BAUG treated 8 bit fans like Luddites even if they owned a couple of ST to. It was a welcome relief from the tension that had been created between the ST and 8 bit fans.

Hi,

Thanks for the warning. I do a lot of ebay transactions each month and over the years I only did meet honest, friendly people. Most people even take there time to help me. Because I sometimes bid on auctions only ment for US only I still bid on them and these people are willing to ship outside the US when you ask them friendly. Even some people where patient to wait 10 days for the money to arrive when they didn't have paypal. But about the things you described, I have heard about it and it should be told to anyone. Because ebay is a great place to find and buy Atari items you can't buy anymore.

>This sort of behavior in my opinion well merits a formal complaint
>to eBay Safe Harbor.

I totally agree on this one. Write an e-mail to eBay and explain to them what happend. Maybe you get some advice or they will take other action. About the posting of feedback, just wait until you get an answer of ebay.

I would like to know what eBay has to say about this kind of behavior because it will damage there reputation...

If I've correctly retained all the sub-sub-sub-sub-"quoting,"
on Wed, 11 Sep 2002 at 08:26:33 GMT, William Kendrick at newbreed
software dot com scribbled this reply to earlier postings:
->>> I'd understand if you wanted to convert Word files to Atari
->>> format, but for the opposite, why not just read the text as
->>> ASCII text and have Word re-save it in its own format?

... to which Marco Antonio Checa Funcke of Lima, Peru, replied
on Thu, 12 Sep 2002 at 02:07:18 -0500:
->>Well, the big problem is that Atari 'plain text' files are in
->>ATASCII. The End-of-Line is different (Decimal 155) and would
->>need to be converted into the 'CR/LF' pair that MICROS~1 WINDOWS
->>expects (Decimal 13, Decimal 10; aka Ctrl-M, Ctrl-J,

I too wrote programs to do these things. The main program, in
Atari Basic with some bells and whistles, was called FILSPLIT. Its
original purpose was to split big files into smaller pieces, which
were saved under their own separate filenames. Usually this meant
reading big ASCII (what we in the old days called "IBM") files and
dividing them into what I called "Atari-sized" files that could be
used by 8-bit programs like Atariwriter.

The programs that dealt with the secondary issues were boiled-
down versions of FILSPLIT, or what I might call the whistle-less
versions mainly for my own use. Whereas FILSPLIT took up 11 sectors
in double-density (DD), the smaller variants were only 2 or 3 DD
sectors long (i.e., up to 6 sectors in single density).

I'm going to post here a copy of the ATASCII to ASCII utility
program I wrote back in 1996. It's small but effective. It does
what our esteemed South American compatriot asked for: converting
ATASCII end-of-line markers to ASCII ("IBM").

->>Another problem would be any inverse-video text ... It'd also be
->>useful to make sure no Atari ATASCII graphics characters (like
->>CTRL-A through CTRL-Z) were left in the file. They'd need to be
->>stripped, replaced with placeholders (like "??????"'s),

My utility program does that. Inverse characters (which are
used as instructions by Atariwriter, for example) are removed. The
paragraph indicator is replaced by placeholders. (Fortunately, I'm
a paragraph fiend! I believe in indenting paragraphs! <grin!>)

->>... or replaced with ASCII approximations.

Well, that's getting too fancy. I didn't bother with that.

->>A simple Unix tool like "tr" could do most of this. Perl could
->>pretty much handle it, easy-as-pie, too, if someone bothered
->>writing something. Of course, since they're trying to convert to
->>Word (like you said, we'd probably just convert to ASCII and load
->>the ".TXT" in Word and save it back out as a ".DOC" manually),
->>I'm guessing they're using Windows, not Linux.

It might also be noted that "MY-UTIL" automatically converts from
Atascii to Ascii. A decade ago My-Util (which has always been my
nominee for the Oscar Award for dumbest program name -- sorry, but
the guy who wrote it should've realized he wasn't the only Atarian
in the world and this wasn't the only utility, and other people also
circulated utility programs that they wrote), also known as "Util,"
was the talk of the town on this newsgroup. My-Util runs in MS-DOS
(on what we used to call the "IBM PC"), reformatting the "IBM"'s
5.25-inch floppy disk drive to read Atari true double density disks.

I'm afraid I haven't used ye olde 8-bit for months, but luckily
I was able to find a copy of my small utility program with my master
DOS-XL disk. I'll type it up now and post it in a separate message.

4685. Conversion Program Word wanted

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-16 00:43:54 UTC
From: edward bonaventure <erasmus@tempests.and.teapots>
Message-ID: <Pine.GSO.4.33.0209152028190.18368-100000@shell1>
Source record: 27507

Here's the Atari Basic program I mentioned in my earlier
posting. It strips out Atariwriter codes (Atascii values of less
than 32), retains paragraph indentation, puts in Ascii end-of-line
markers (control-M, control-J), and keeps line length at 78 or less.
It tries to end lines between words but once in a while an extremely
long word may fool it and be divided between two lines.

```
10 REM Atascii to Ascii, by d.m., Rev. 4, 04.23.96
20 DIM A$(20)
30 TRAP 230
40 PRINT "Input Dx:filename"
50 INPUT A$
60 OPEN #1,4,0,A$
70 PRINT "Output Dx:filename"
80 INPUT A$
90 OPEN #2,8,0,A$
100 Z=0
110 GET #1,X
120 IF X=16 THEN 250
130 IF X<32 THEN 110
140 Z=Z+1
150 IF X=155 THEN 300
160 PUT #2,X
200 IF Z=78 THEN 300
210 IF Z>68 AND X=32 THEN 300
220 GOTO 110
230 CLOSE #1:CLOSE #2:END
250 FOR P=1 TO 4
260 X=32:Z=Z+1
270 PUT #2,X
280 NEXT P
290 GOTO 110
300 X=13:Y=10:Z=0
310 PUT #2,X:PUT #2,Y
320 GOTO 110
```

This program is intended to be barebones but with a few
features. The problem with making a program much smarter than this
is that it slows down tremendously when run on the 8-bit.

```

Interesting. I was a member back in the '83 - '85 time frame. Trey
Pitruzello (I think that's how it was spelled) was president at the time. I
did disk copying for the club. I was also the club Ballblazer champion.
Used to spend time and money at a store in downtown Hayward. Can't remember
the name. One of the guys who ran it was named Kim, a portly fellow. I
also ran a BBS at the time, The Wolves Den. Ah, those were the days. :)

Paul

I have interlisp, I got it from antic publishing during their "fire sale" just
before they went bust. that deal with what was it? 5 or 10 programs for $50?
all the documentation was on the backside of the disk, which when booted would
let you either print it or view it on screen.

4689. New version of JPEG viewer released

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-16 01:14:00 UTC
From: rjespino@hotmail.com
Message-ID: <9ee50737.0209151714.642cdc06@posting.google.com>
Source record: 27511

This has been a long time in coming, but version 0.8 of a8jdpeg is now available:
http://a8jdpeg.atari.org
http://a8jdpeg.webhop.org

a8jdpeg is a JPEG viewer for the Atari 8-bits, based on the C=64's
Juddpeg decoder (http://www.ffd2.com/fridge/) written by Stephen L. Judd.

This version replaces the release dated 07Aug01, and includes the following changes:
* Added dithering to most modes. This improves the displayed image quality.
* Added image information/help screen.
* Images can now be saved while displayed in modes 2, 3, D and E.
* The jagged borders at the image edge in HIP mode have been eliminated.
* Added default filename on the save prompt.
* Viewer now defaults to mode E (HIP) in 64K and mode 5 (GR.9) in 48K
* Inverse video and upper/lower case keypresses are now handled in all menus.
* Fixed problem with the last column in certain images being repeated when
an offset was used.
* The decoder won't abort on images with Huffman errors if they contain restart
markers.
* Replaced the raw save option with a PGM (Portable Gray Map) save option.

Note:
The 64K display modes use the RAM under the OS, and hence will crash most
versions of SpartaDOS. These should work fine with BEWEDOS though.
The 48K display modes should work fine with any version of SpartaDOS.

Comments, suggestions, bug reports, feedback, etc. are welcome.

i once had a compact presarion laptop. i was spoiled.. and stupid. it locked up. i lost my cool. flying across the room it went. i had a card reader that plugged into thepcmcia slot on the side. the thing is a cart adapter with the connector needed being ppins. in all actuality it is merely a precise allignment of wires that needs only be connected one time. aftet which leaves a functional cartridge port. now for the other side. i used , instead of what might be called for, individually, perfectly snug fitting telephone wire(sollid). now i have coloor coded loose,, fee, wires with thich i can do anything i please. infoulable and hyper conventient.. am i not sollvinng this for you?

feeling unheard,

I've soldered for 12 years straight, I am pretty good, but surface mount
stuff not even I would want to tackle that.

> If anyone has any ideas, that would be great. Otherwise the project is on
> hold.

Any chance you can provide an image of some sort of the connector you
are seeking, a URL, anything. Also, does this project have a website?

Tony,
If you can find a source for the receptacles, I'm all about giving it a shot, but I've looked everywhere, and I can't find a usable connector. There's no way I can do the top mount adapter, though.

This is one of the better connectors, in my opinon:
http://www.tekais.com/compact_flash_info.htm

There seems to be a lot of interest in the project, but I just haven't been able to find a source for the connectors. That's really all I'm lacking at this point. I've got a board layout ready to order, I've got all the parts short of the boards and the connectors, so I'm ready to go, but without a connector, there's no way to proceed.

Pete: Looking at the connectors, I think you can use the surface-mount sockets - just open the pins (bend them up a little) and slide them on the card edge. The AMP 146839 seems good for this, but the Digi-Key parts aren't so clear. I don't know what you are paying for these connectors but an IDE adaptor may be the way to go.

4705. The "Impossible" from CSS

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-16 04:16:08 UTC
From: llpwhite@cs.com
Message-ID: <20020916001608.00783.00000130@mb-fh.news.cs.com>
Source record: 27527

Today, I was looking through some disks that I received recently, and there is an original "Impossible" V1.7 disk (but no docs). IIRC, the original Impossible was for the 800 and required a static ram pack that was installed in the $C000 - CFFF address space (?). Later, an XL/XE version was released that required no added hardware (?) I don't know which version I have here. My idea/guess from years ago about how it worked was that the Impossible controlled the disk loading process (after first being saved under the Impossible control) and whenever some type of copy protection was required, the Impossible supplied an error or what ever info the actual program was looking for during the load.

Anyone have a better idea of how this thing works, and what type I've got in the V1.7?
Thanks,
Larry

Bob,
I tried bending the pins. There were a number of problems with that. The pins are amazingly delicate and were very hard to keep lined up properly when bending them. Also, when they separated, one row seemed to extend out, while the other seemed to retract, leaving one row extended beyond the other. If I were to mount in this fashion, the connector would be aiming up at about a 30 degree angle.

While this kind of stuff is fine for prototyping, my goal is to create something other people can use. I don't want to have to tell people "okay, separate the 50 pins on the connector in this fashion, without disturbing the alightment. Now saw off the housing of the connect so it doesn't interfere with mounting. etc". I'd like to know what the layout of the final adapter is going to be because even if I managed this connector for a prototype, it would require modifications to the board layout in a follow-up run, and I'd like to keep board layout mods to bugs, to narrow possibilities of adding new problems between runs.

Pete

I'm convinced that eventually I'll find a source for the connectors.

How come there is only one negative feedback on her profile....

http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=groovyfun

That's why it's important to post feedback, without passing judgement the aforementioned user, so others do not get "burned".

By the way, the original auction DID NOT mention a power supply included, however, it did mention other auctions that she was holding for Atari power supplies...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1377001181

You be the judge...

Well it appears 3 of you got burned by her, yet she only has 1 negative. You have no room to complain if you didn't give her a negative. How will others know to avoid her? Honest feedback is at the heart of this system. So she gives retaliatory negative feedback. That's unfortunate but it's not going to hurt you...just add a comment to it stating it was retaliatory. Be man enough to give honest feedback.

Now on to the case at hand. Reading the description of the auction:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1377001181

I would not expect a power supply to be included. Just because she wrote "this system is in great working order" does not imply a power supply is included. Was there one in the picture? The original poster/auction winner had plenty of time to ask if one was included. Had I been selling this system I would have explicitly stated there is no power supply but had I been the buyer I wouldn't have expected one to be included.

Paul

Well, it says system. I'd expect a system to be useable on it's own
unless it needed some very common extras like tv. The power supply I'd
imagine is not super common like tv :)

I remember Years ago, that one of the big Word Processors (Either Word or Word Perfect) had an ATASCII conversion in it. I don't remember the version or even which program it was, but I do remember that a subsequent upgrade dropped the conversion template (or whatever it was). I do remember that it was a Windows-based program though. Anyone else remember this?

Sometimes ebay sellers act as if they send the item again and again, until the three months are gone and you can not give negative feedback anymore. In such cases I recommend bidding again on one of the sellers items, not paying ofcourse. That way you can still give a neg. feedback.

Freddy.

I would expect a "system" to include the power supply and all related cables that came in the box from the OEM.

Really! Atari or Commodore did not sell the system without a power supply or cables and expect you to buy it separately before you could power up the unit. Anytime I sell or even give a system or drive to someone without a power supply or cables I (over)state it so they are not disappointed because it is expected.

I was also stiffed by the person, I purchased a XF551 and it had far more damage to it than the "good" condition she posted, the case is entirely cracked. The listing also listed a power supply, for which she wants to sub a key pad, because she doesn't have a power supply. When I checked her feed back at that time I bid, she had three negatives, is she clearing them somehow? Anyway I'm about to leave my negative experience on ebay for her, since I still haven't even recieved the replacement p/s and tomorrow is three months. So in the end be careful.

On a 20+ year old computer, take nothing for granted. Do you expect
warranty card and manual too? That's why when I auction I list every scrap
of paper I'm including. When I bid I expect nothing that is not explicitly
stated. "System" is not clearly defined, and while an Atari fan might
consider "system" to also encompass a power supply, the casual reseller will
probably not hold to such a strict definition.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Yes, you are right. But the problem is that it doesn't get your money back.
So, when a seller keeps communicating, like the package might get lost in
the mail and things like that, and surface mail takes at least six weeks.
Ok, I know better now, but in the beginning some sellers can rip you off
with these excuses. IMO the buyer is not enough protected on ebay.

Freddy.

Here's what TXG said 9 days ago.

>So it seems the subject is closed now...

>THE END...

>TXG/MNX

I knew better.

Stuff I never heard about ('3E Software?').
Old times about SLCC.
The history and who did what and who owns what
is no clearer to me know than it was 2 weeks ago.
I'm talking about Sp 3.3 a, b, c.

Lance, All I can say is Good luck with your Products as I for one am still abit Flamed about Mr. Klaas... He never once even bothered to call me and let me know that he had sold BBS PRO... He did however call me a number of times during the time I was Beta Testing BBS Pro and well lets just say I don't enjoy talking to people that are deeply into the bottle... I have done my best to support BBS Professional over the years it was Fun while it lasted... I Do still talk with Ken Ames, Stephen Carden, and afew others from time to time...

You spoke of Jim Hood whom I use to enjoy at the Club Meetings... It was a Very sad day when he died... Alot of people had the pleasure of meeting this man but no one was more pleased then myself as he was one that would go out of his way for the Club as well as Bob Woolley... The Club is Still infact going strong from what I've heard... Ran into the club president Robert Bridges and Bob Woolley at a computer store this last week... It was Fun to see them both after a long absence from the Club due to the place we used to have the meetings was being refurburbished...

But as far as carrying someone elses Water here I seem to miss your point...
I had seen a post where Ken was trying to update a fellow atari user with X33C.DOS and you claiming the rights to it and so on... Well After I spent like a Weekend down at FTe installing his BBS Professional since he had no clue on how to even make a batch file to install the dang thing as well as lending him an MIO and Modem... kinda pissed me off since I was At Stephen Cardens at the time the DOS's was written... Kenny had showed up as well... So I too know the History of the DOS's...

FTe left alot of people with bad taste in their mouths as well as their pocket books... Now don't get me wrong here... Mike had some Good Ideas... But the One he had working on those Ideas was people he could get for Free so he thought... Bob Woolley was one of those people, Stephen was another, Bob Klass was also, and myself included... So yeah I can understand when you say its been going on since the late 1980's and 1990's...

Sorry to seem to be Rambling on here folks... But there is alot of untold History here... Infact Lance, You may contact me thru my e-mail addy here if you wish to move this to privite... learl6@attbi.com
